

개발환경 구축:

Cross compiler, bootp, tftp, NFS 등

단국대학교

컴퓨터학과

2009

백승재

baeksj@dankook.ac.kr

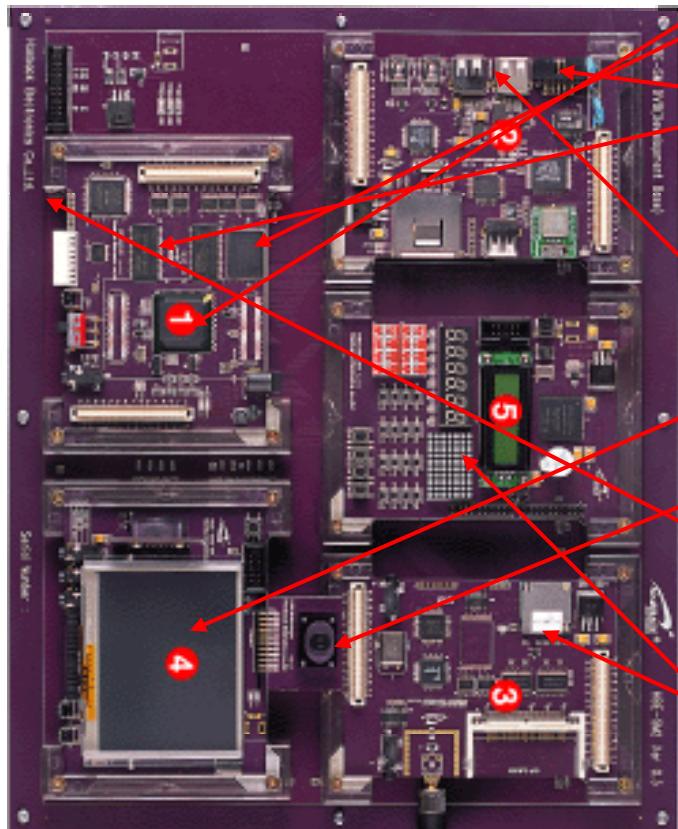

<http://embedded.dankook.ac.kr/~baeksj>

강의 목표

- Target board에 대한 기본적인 이해
- 개발 과정 이해 및 환경 구축
- 개발 사례 파악

Target board

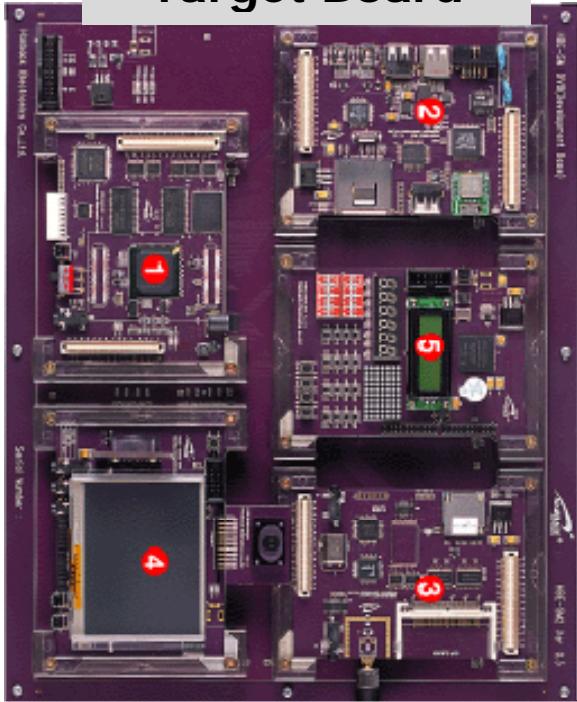

■ HBE-SM II-P320

Items	Hardware Specifications
CPU	Marvell PXA320B1C806 (806MHz)
Memory	NAND Flash Memory : Samsung K9F1G08U0B (128M x 8bit) Mobile-DDR RAM : 128MByte (512Mbit x 2ea)
FPGA	Altera Cyclone-II (EP2C8F256C8ES) x 2ea
CPLD	Altera MAXII (EPM1270GF256C5) x 1ea
SRAM	Samsung K6R4016V1C (256Kx16 Bit) x 3ea
Ethernet	1 Port 10/100Base-T Ethernet
Audio	AC'97 Audio Codec (Built-in Touch Screen I/F) 1 Port Stereo Out (Stereo Jack), 1 Port Line IN (Stereo Jack), 1 Port MIC IN (Stereo Jack)
LCD	3.5" TFT LCD 1ea
Touch Screen	3.5 Touch Screen x 1ea
Camera	1.3M Pixel CMOS Camera x 2ea
USB	USB 1.1 Host : A type Connector x 1ea USB 1.1 Client : Mini type Connector x 1ea USB 2.0 Host : A type Connector x 1ea USB 2.0 OTG : Mini type Connector x 1ea
UART	RS232 Level : Stereo type Connector x 3ea 3.3V TTL Level : 2 Port for GPS & Bluetooth : 1 Port
I ² C	1 Port
IrDA	1 Port (Compliant to IrDA 1.1)
Storage	1ea CF Connector 1ea SD / MMC Connector
Wireless LAN	1 Port Wireless LAN (IEEE802.11b/g)
I/O Application	Text LCD, 7-Segment, Dot Matrix (7 x 5 x 2ea), Key Pad (4 x 4), DIP Switch (8point x 2ea), LED (8ea), Buzzer, Tact Switch (4ea)
I/F Module	1ea Bluetooth Module (On-Board)

Step1: Serial port & minicom setup

Target Board

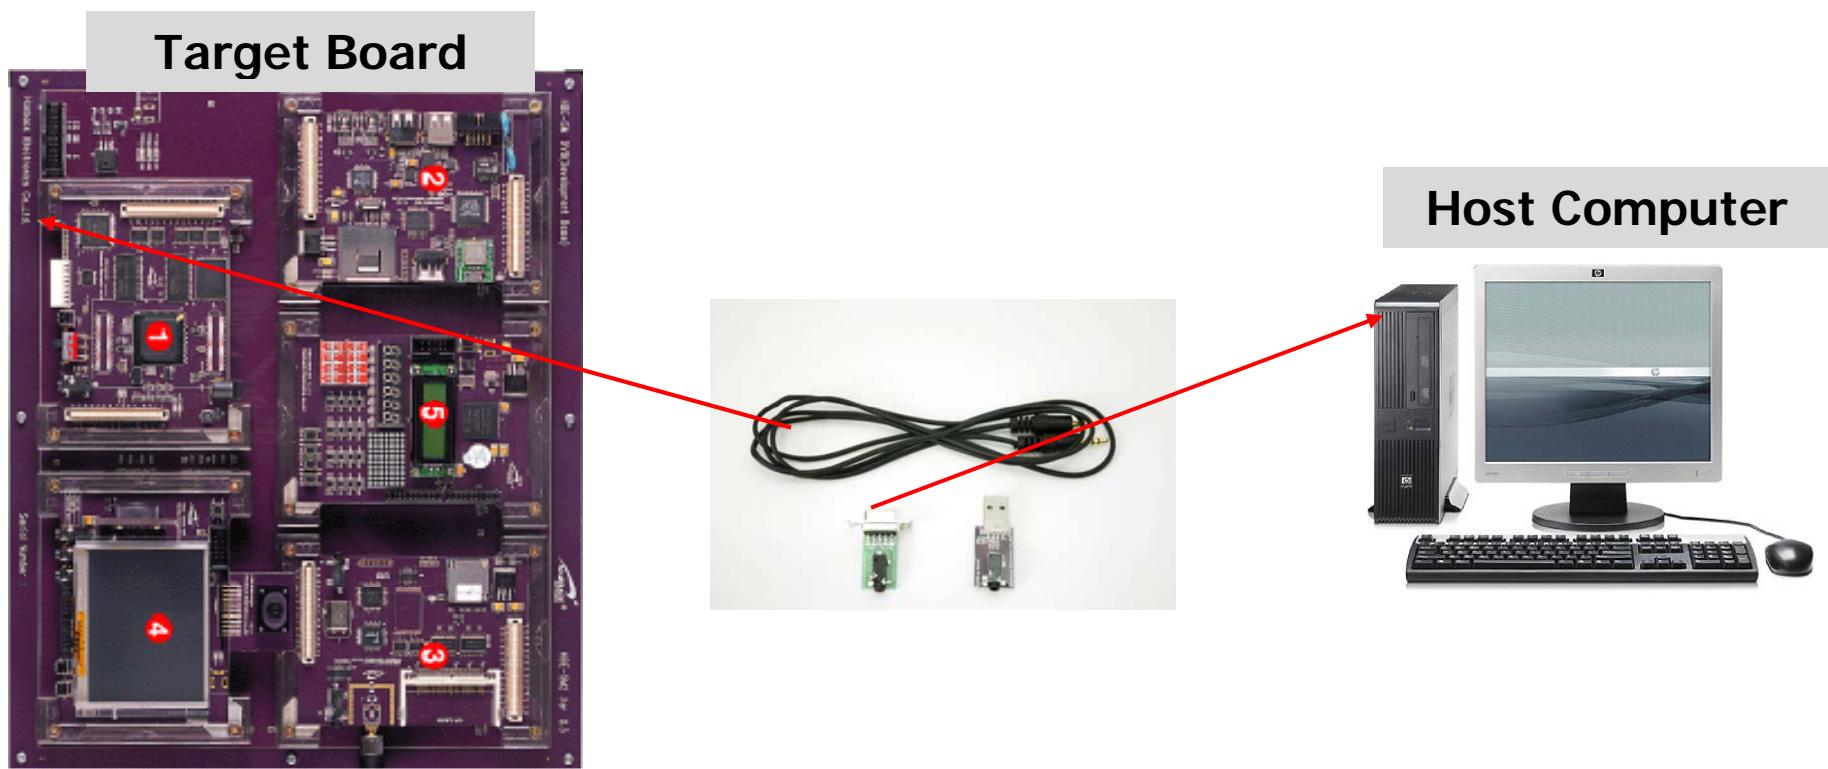

Host Computer

- Target board have no ‘monitor’
- Serial port와 minicom 프로그램을 이용해 보드에 가상적인 모니터를 만들어 주자

Step1: Serial port & minicom setup

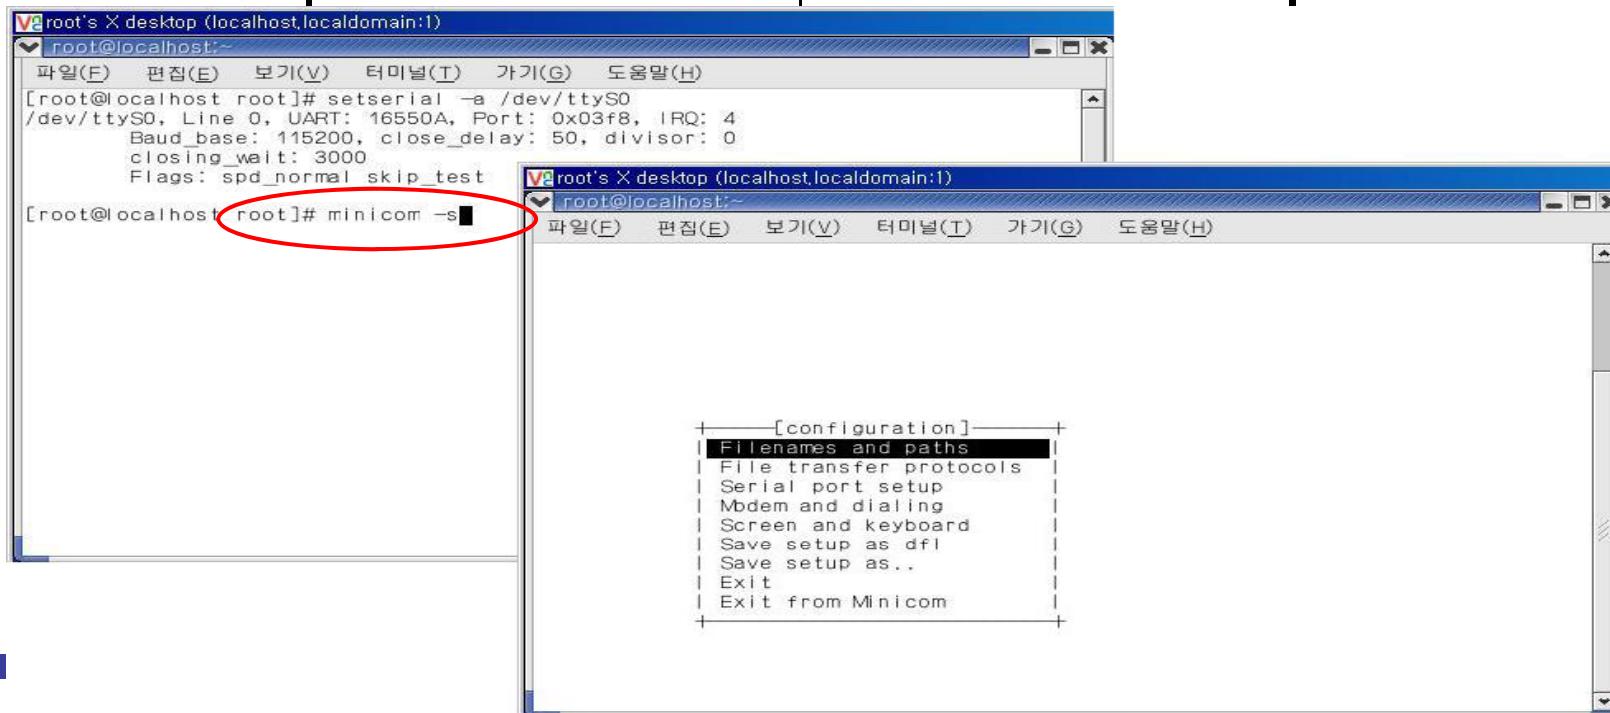

- Serial이나 USB 둘 중 하나만 사용하여 target board와 host computer를 연결

Step1: Serial port & minicom setup

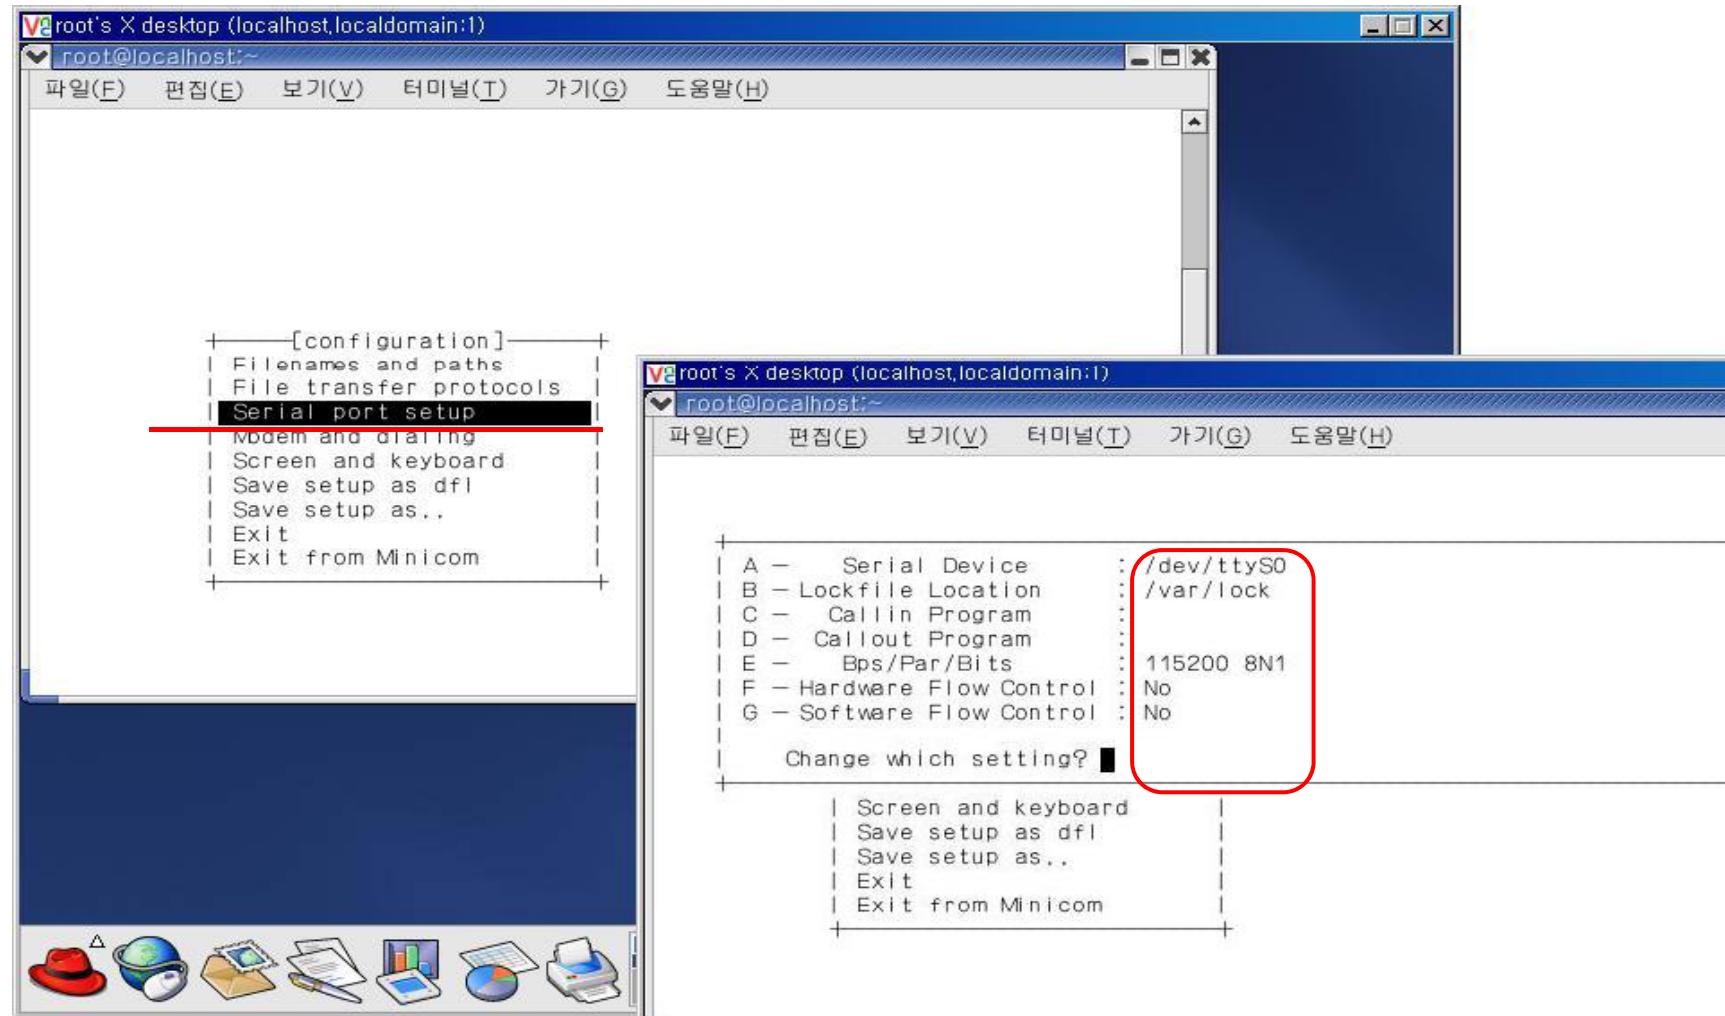

- minicom : 리눅스용 터미널 에뮬레이터
- 2. Minicom 환경 설정

Boudrate	115200bps
Date Size	8
Parity	None
Stop bits	1
H/W flow control	NO
S/W flow control	NO

Step1: Serial port & minicom setup

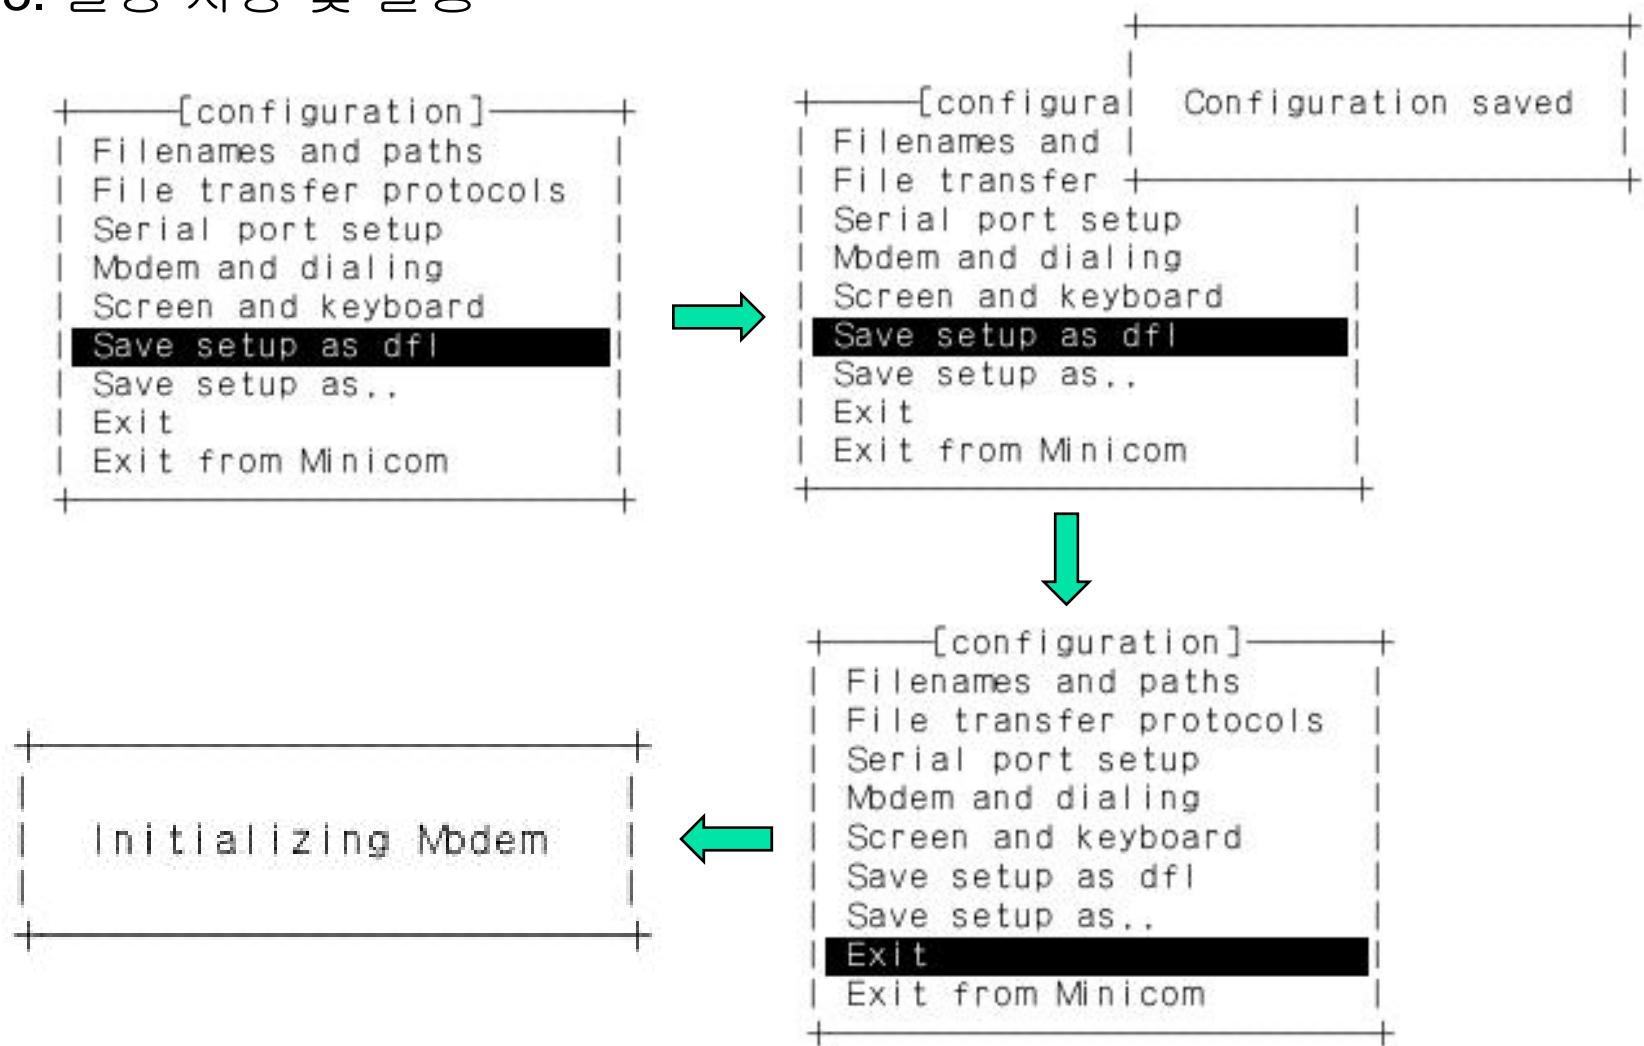

- minicom : 리눅스용 터미널 에뮬레이터
2. Minicom 환경 설정

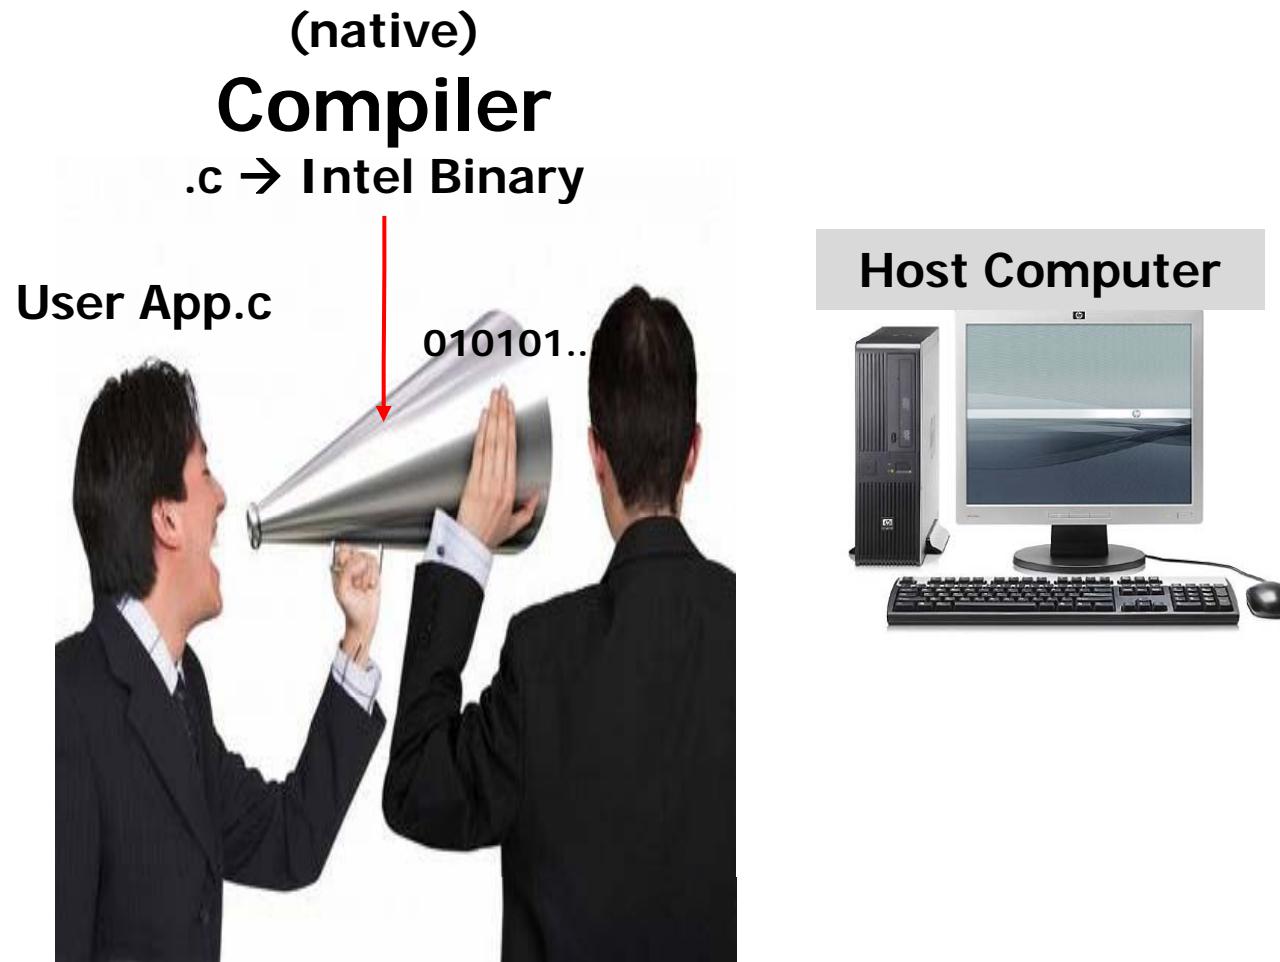

Step1: Serial port & minicom setup

■ minicom : 리눅스용 터미널 에뮬레이터

3. 설정 저장 및 실행

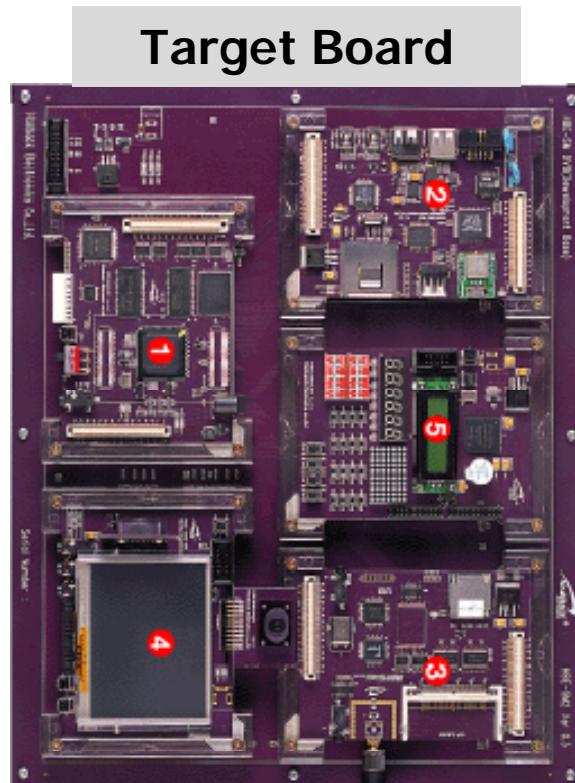

Step2: Cross compiler

- Native compiler
 - ✓ generates code for its own execution environment

Step2: Cross compiler

(cross)
Compiler
.c → ARM Binary

- Cross compiler
 - ✓ executes in one environment and generates code for another

Step2: Cross compiler

- Cross compiler
 - ✓ Modify the compiler, compile the compiler and use it
 - ✓ Download the compiler(already modified) for your architecture
 - tar.gz
 - rpm, ...
- HBE-SMII-P320 보드의 경우 CD에 cross compiler를 제공한다
 - ✓ /usr/local 디렉토리에 압축해제 한 후
 - ✓ PATH 설정 하여 사용하면 된다

Step2: Cross compiler

The screenshot shows a terminal window titled "root's X desktop (localhost,localdomain:1)" with the command prompt "[root@localhost mds]#". The window displays the following sequence of commands and file operations:

```
[root@localhost mds]# pwd  
/dev_board/mds  
[root@localhost mds]# vi test.c  
[root@localhost mds]# ls  
arm-linux-tools.tar.bz2      s3c2410_kernel2.4.18_module_mmc.tar.bz2  
bootp_2_4_3_7_i386.rpm       s3c2410_kernel2.4.18_r1.1.tar.bz2  
cross_2.95.3.tar.bz2         s3c2410_vivi_r1.0.tar.bz2  
jflash_s3c2410.tar.gz        sjf2410_v4.zip  
linux                         test.c  
root.cramfs                  tftp_server_0_17_9_i386.rpm  
root_qtopia.cramfs           ztelnet_0.9.1_7mz_i386.rpm  
[root@localhost mds]# arm-linux-gcc -o test_arm test.c  
[root@localhost mds]# ls  
arm-linux-tools.tar.bz2      s3c2410_kernel2.4.18_r1.1.tar.bz2  
bootp_2_4_3_7_i386.rpm       s3c2410_vivi_r1.0.tar.bz2  
cross_2.95.3.tar.bz2         sjf2410_v4.zip  
jflash_s3c2410.tar.gz        test.c  
linux                         test_arm  
root.cramfs                  tftp_server_0_17_9_i386.rpm  
root_qtopia.cramfs           ztelnet_0.9.1_7mz_i386.rpm  
s3c2410_kernel2.4.18_module_mmc.tar.bz2  
[root@localhost mds]#
```

Red circles highlight three specific actions: the directory listing command "ls", the compilation command "arm-linux-gcc -o test_arm test.c", and the resulting executable "test_arm" in the second "ls" output.

Step2: Cross compiler

```

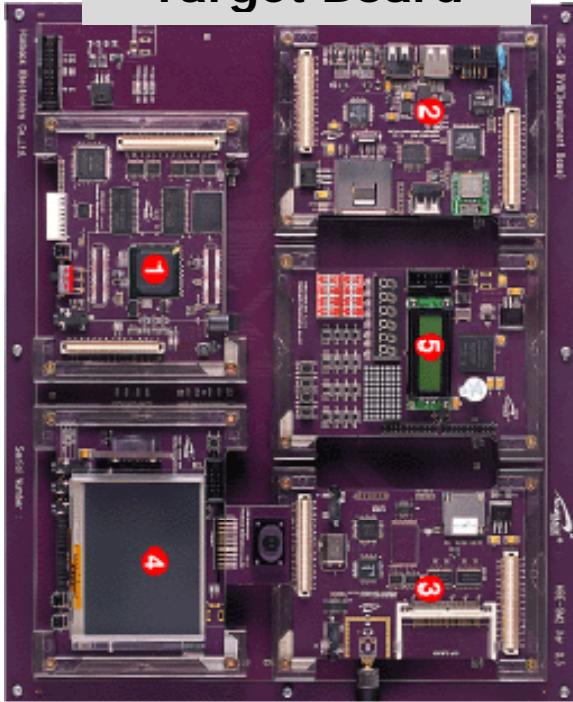

root's X desktop (localhost,localdomain:1)
root@localhost:/dev/ board/mds
파일(F) 편집(E) 보기(V) 터미널(T) 가기(G) 도움말(H)
root.cramfs                                     tftp_server_0_17_9_i386.rpm
root_qtopia.cramfs                             ztelnet_0.9.1_7mz.i386.rpm
s3c2410_kernel2.4.18_module mmc.tar.bz2
[root@localhost mds]# gcc -o test_ia test.c
[root@localhost mds]# ls
arm-linux-tools.tar.bz2                         s3c2410_kernel2.4.18_r1.1.tar.bz2
bootp_2_4_3_7_i386.rpm                         s3c2410_vivi_r1.0.tar.bz2
cross_2.95.3.tar.bz2                           sif2410_v4.zip
jflash_s3c2410.tar.gz                          test.c
linux                                         test_arm
root.cramfs                                     test_ia
root_qtopia.cramfs                            tftp_server_0_17_9_i386.rpm
s3c2410_kernel2.4.18_module mmc.tar.bz2        ztelnet_0.9.1_7mz.i386.rpm
[root@localhost mds]# file test_arm
test_arm: ELF 32-bit LSB executable, ARM, version 1 (ARM), for GNU/Linux 2.0.0,
dynamically linked (uses shared libs), not stripped
[root@localhost mds]# file test_ia
test_ia: ELF 32-bit LSB executable, Intel 80386, version 1 (SYSV), for GNU/Linux
2.2.5, dynamically linked (uses shared libs), not stripped
[root@localhost mds]# ./test_ia
HH~~ Cross Compile is Very EASY~~~ ^;
[root@localhost mds]# ./test_arm
bash: ./test arm: cannot execute binary file
[root@localhost mds]#

```

각 파일이 어느 아키텍쳐에서 실행 가능한지 확인할 수 있다.

Step3: JTAG

Target Board

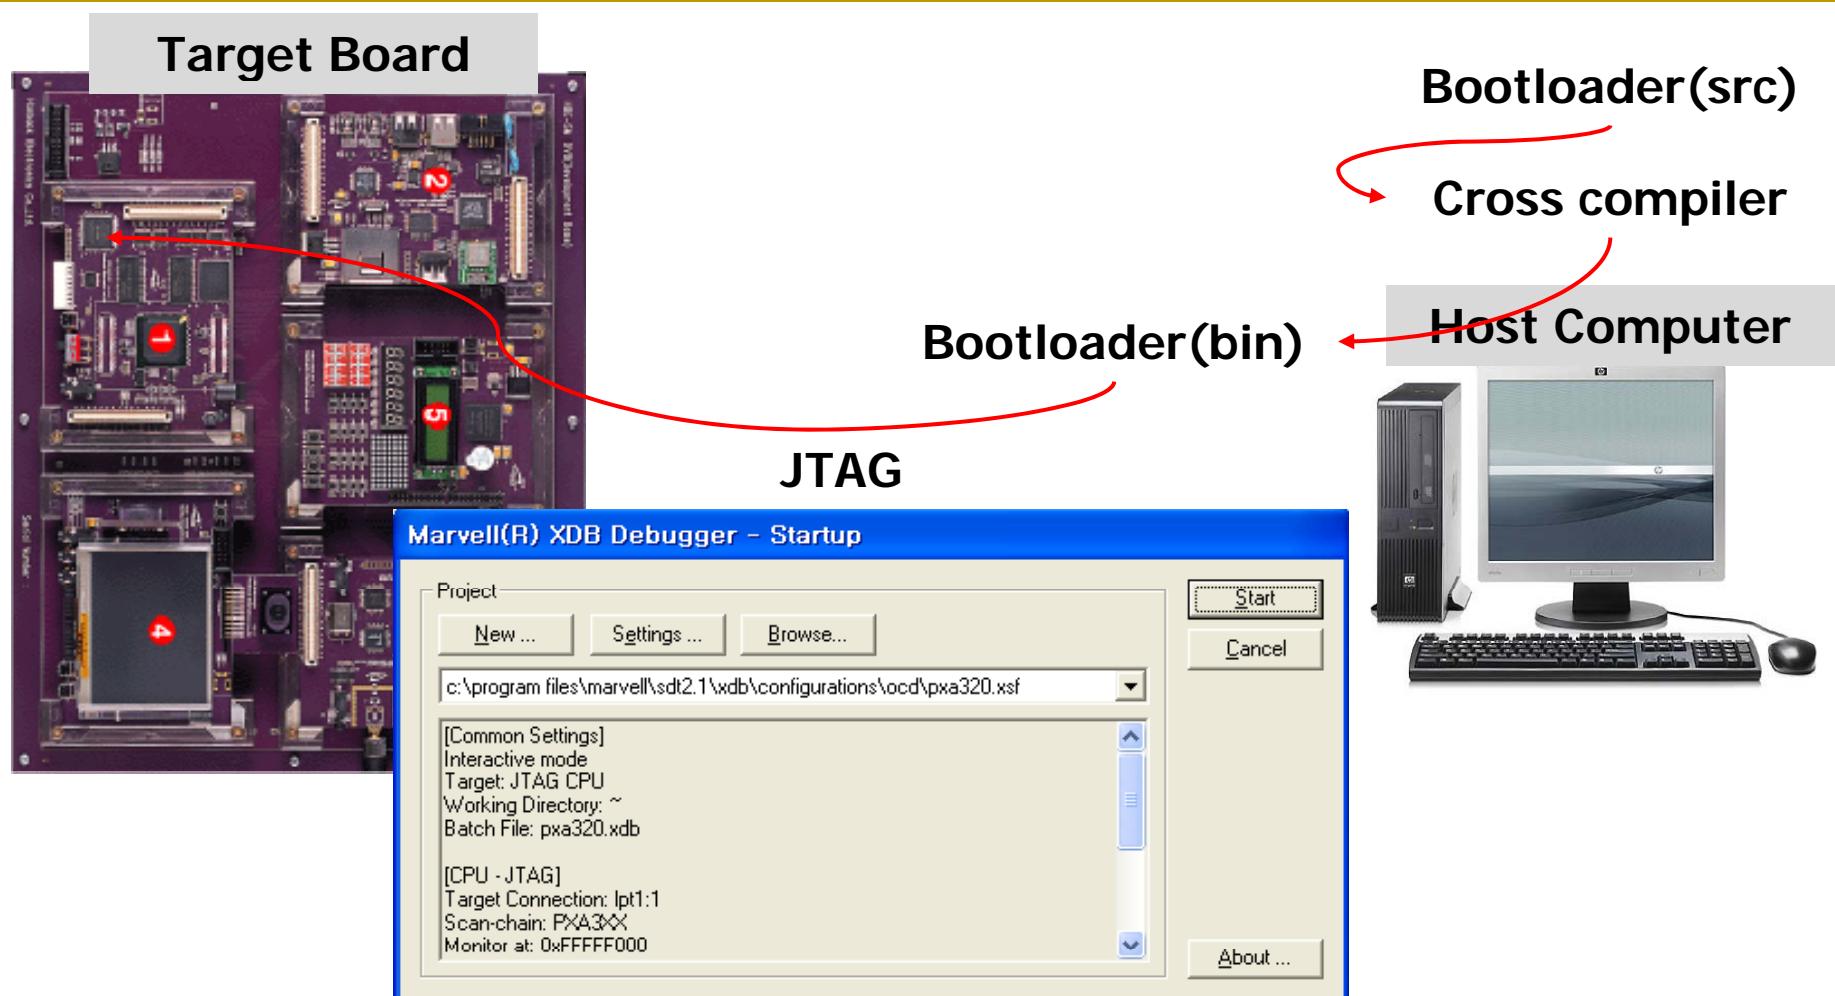

Host Computer

- PC of ARM cpu have the value 0x00000000 after power on
- Bootloader must be written in 0x00000000
- NOR flash memory located in 0x00000000

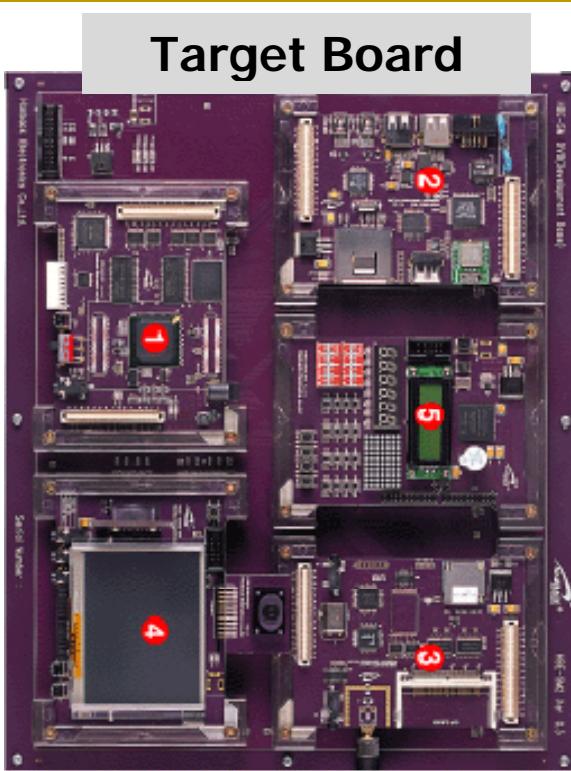

- How can you writing bootloader into NOR flash memory?

Step3: JTAG

- In the Linux?

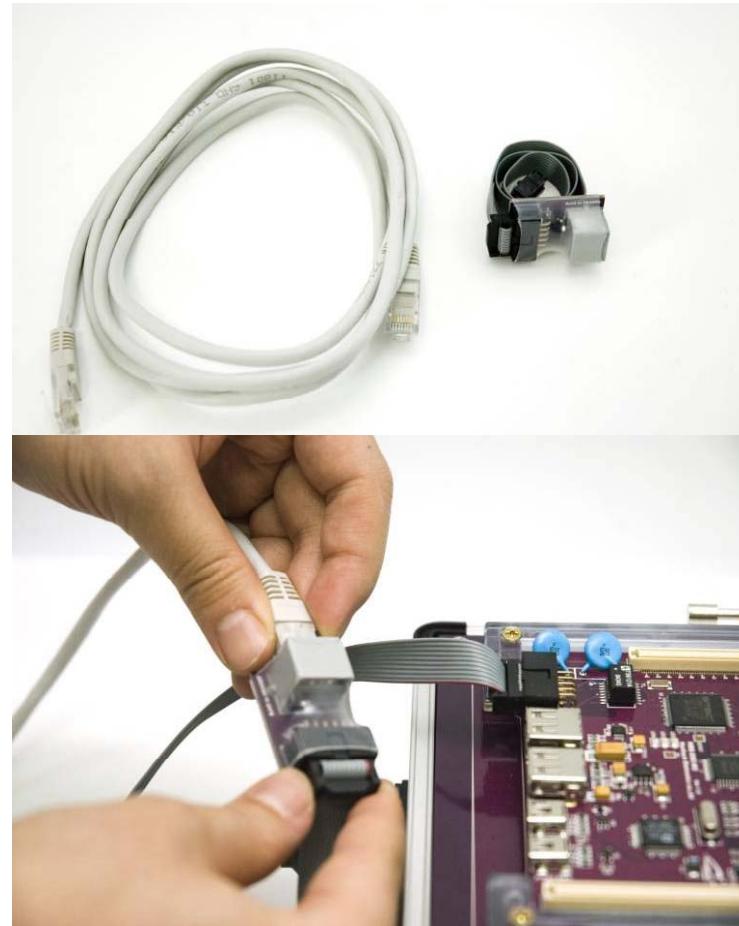

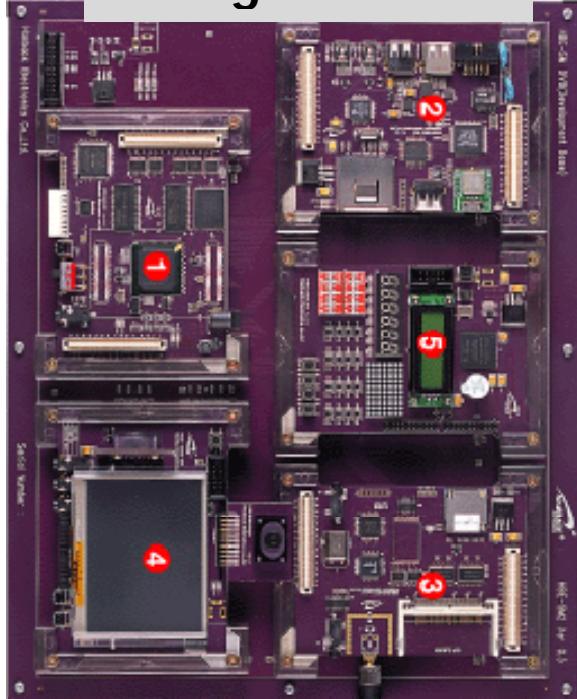

Step4: bootp

- Bootloader will running on the target board
 - ✓ You can use peripherals
- Kernel image and rootfilesystem also should be written to Flash memory on the board
- Use faster interface than JTAG

Step4: bootp

Target Board

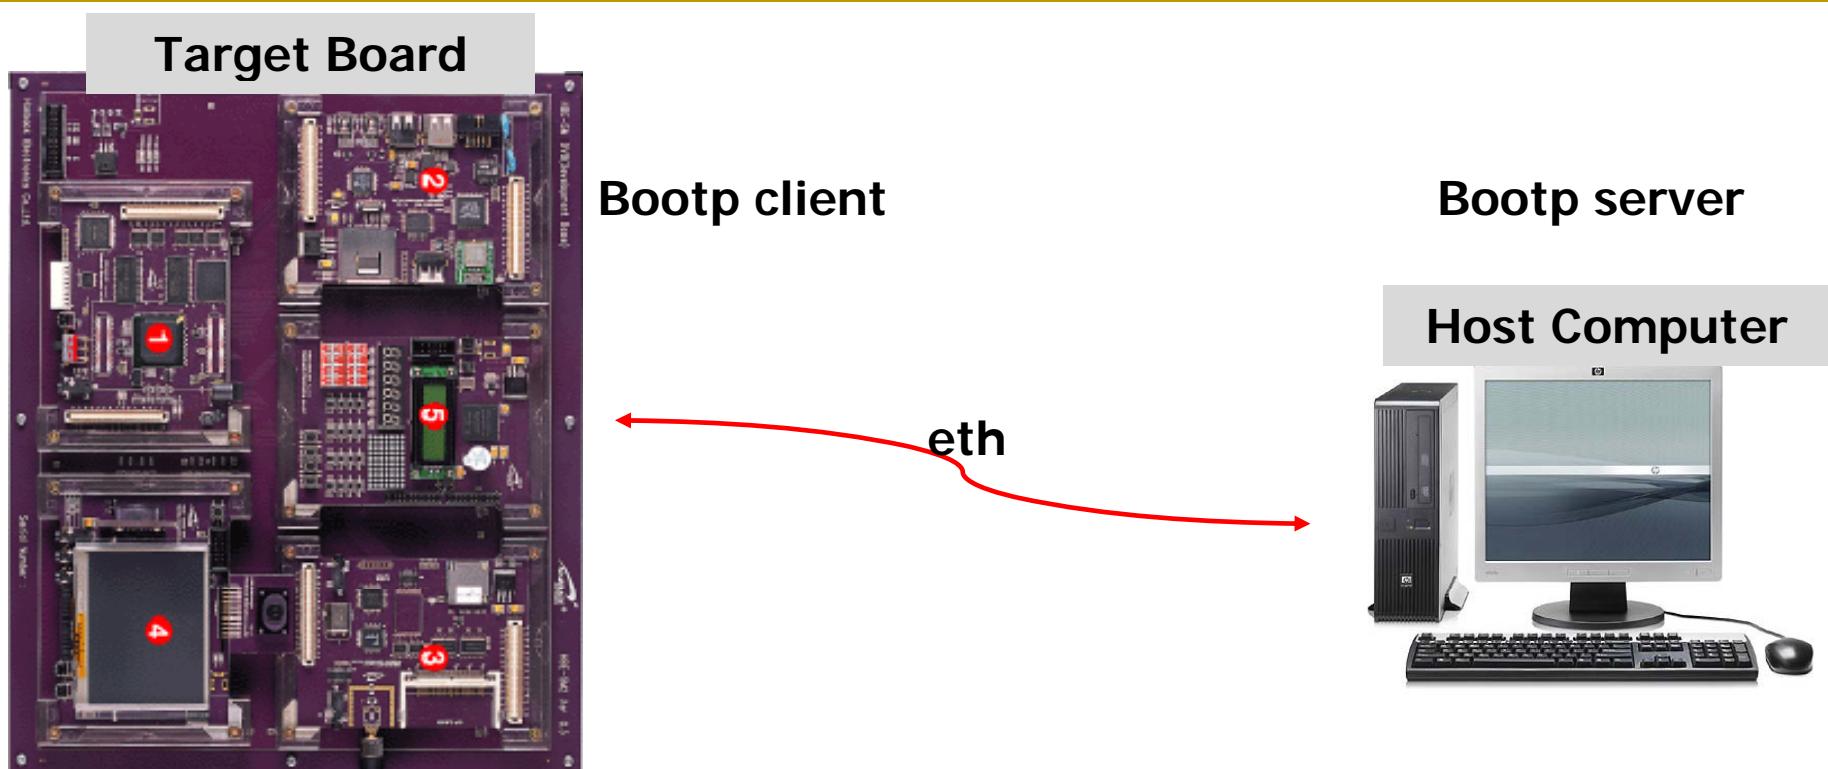

Host Computer

- (Cross)Ethernet cable 연결

Step4: bootp

- IP address required(for target board)
- You can get IP address automatically using DHCP if there is DHCP server
- Bootp (your host computer shoud be bootp server)

Step4: bootp

The screenshot shows three terminal windows on a Linux desktop environment. The top window shows the command to check for the bootptab file in /etc:

```
[root@localhost tftpboot]# cd /etc
[root@localhost etc]# ls -al | grep bootptab
-rw-r--r-- 1 root root 133 9월 10 22:02 bootptab
```

The middle-left window shows the content of the bootptab file:

```
.default:
:hd=tftpboot:bf=null:
:sm=255.255.255.192
ami board:
ht=1:
ha=0x122221122221:
tc=default:
ip=192.168.184.138:
```

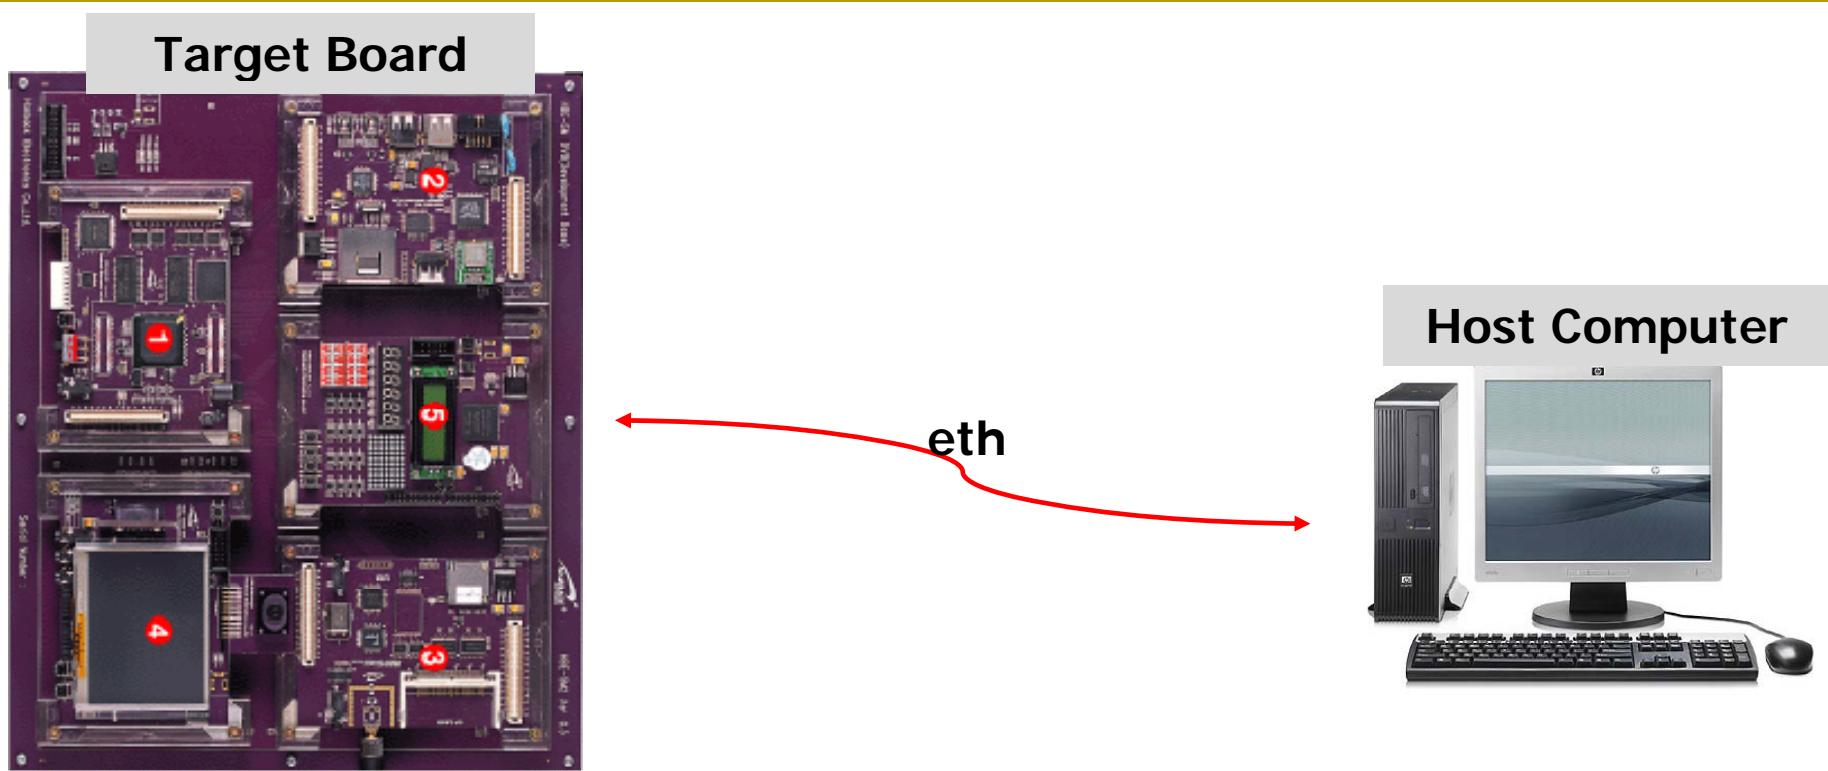

The middle-right window shows the command to check for the bootp service in /etc/xinetd.d:

```
[root@localhost etc]# cd /etc/xinetd.d
[root@localhost xinetd.d]# ls -al | grep bootp
-rw-r--r-- 1 root root 171 9월 7 12:23 bootp
[root@localhost xinetd.d]# vi bootp
```

The bottom-right window shows the configuration of the bootp service in xinetd.d:

```
service bootps
{
    disable          = no
    flags            = REUSE NAMEINARGS
    socket_type     = dgram
    protocol        = udp
    wait            = yes
    user            = root
    server          = /usr/sbin/bootpd
    server_args     = -s
}
```

Step4: tftp

- What program do you use when you download some files from server?
- You can download file from FTP server using FTP client program
- TFTP(your host computer should be tftp server)

Step4: tftp

The screenshot shows two terminal windows side-by-side. The left window displays a command-line session where the user is navigating through the /etc/xinetd.d directory, listing files, and editing the tftp service configuration. The right window shows the contents of the /etc/xinetd.d/tftp file, which defines the tftp service parameters. A vertical scroll bar is visible between the two windows.

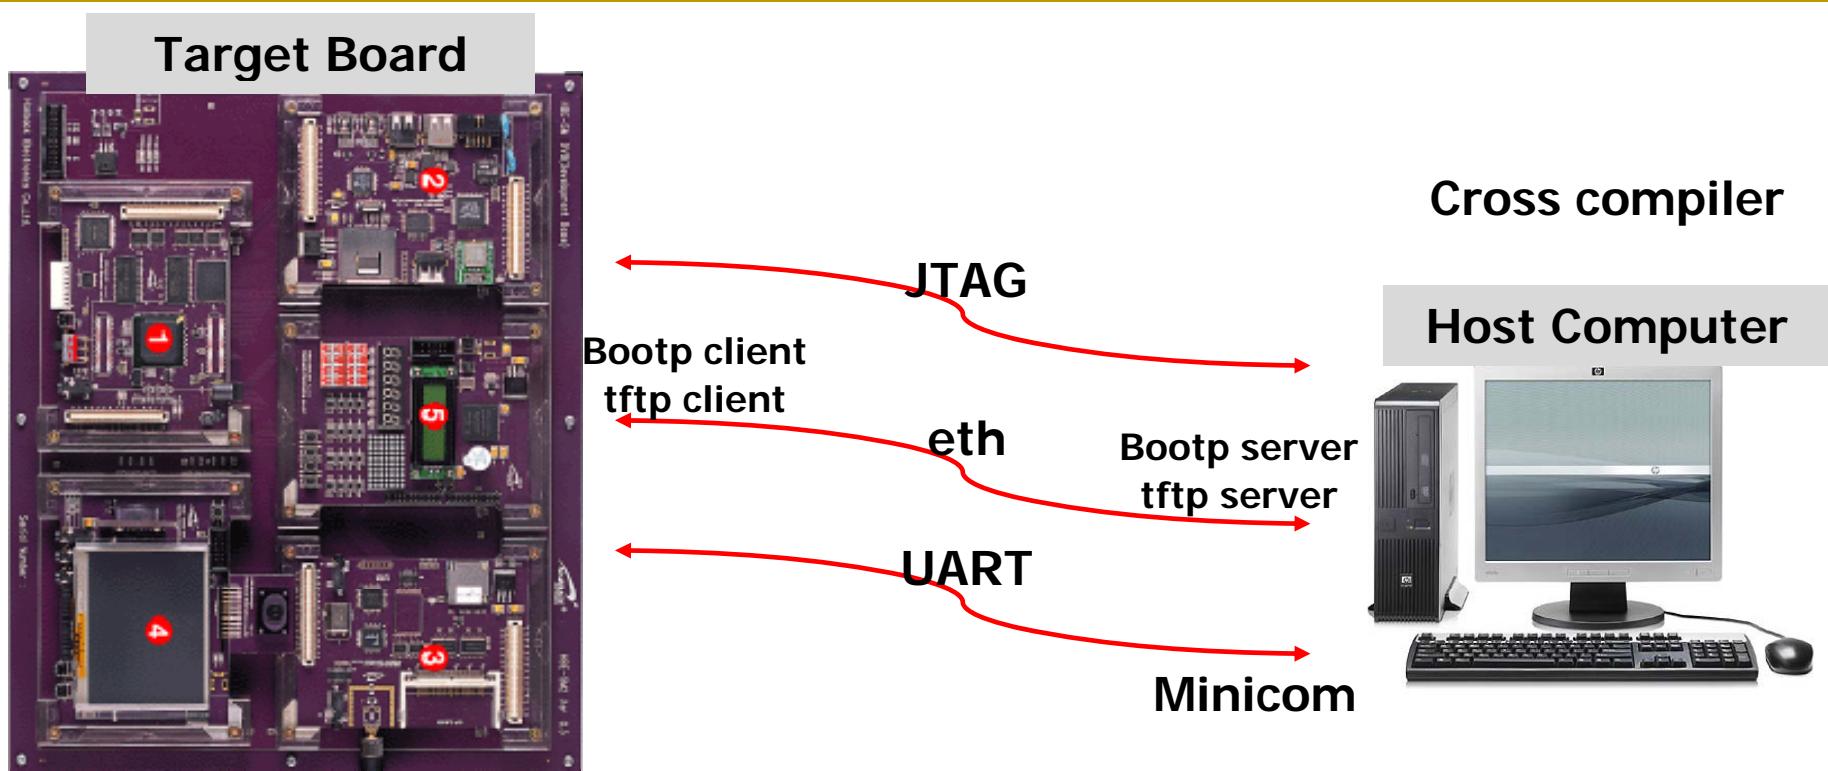

```
[root@localhost xinetd.d]# pwd
/etc/xinetd.d
[root@localhost xinetd.d]# ls -al tftp
-rw-r--r-- 1 root root 509 9월  7 12:24 tftp
[root@localhost xinetd.d]#
[root@localhost xinetd.d]# vi tftp
```

```
# default: off
# description: The tftp server serves files using the trivial file transfer protocol.
#               The tftp protocol is often used to boot diskless workstations,
#               download configuration files to network-aware printers,
#               and to start the installation process for some operating systems.
service tftp
{
    socket_type      = dgram
    protocol         = udp
    wait             = yes
    user             = root
    server           = /usr/sbin/in.tftpd
    server_args      = -s /tftpboot
    disable          = no
    per_source       = 11
    cps              = 100 2
    flags            = IPv4
}
```

```
[root@localhost xinetd.d]# service xinetd restart
xinetd 를 정지함:
xinetd (을)를 시작합니다:
[root@localhost xinetd.d]#
[root@localhost xinetd.d]#
[root@localhost xinetd.d]# netstat -a | grep bootps
udp        0      0 *:bootps            *:*
[root@localhost xinetd.d]# netstat -a | grep tftp
udp        0      0 *:tftp              *:*
```

[확인] [확인]

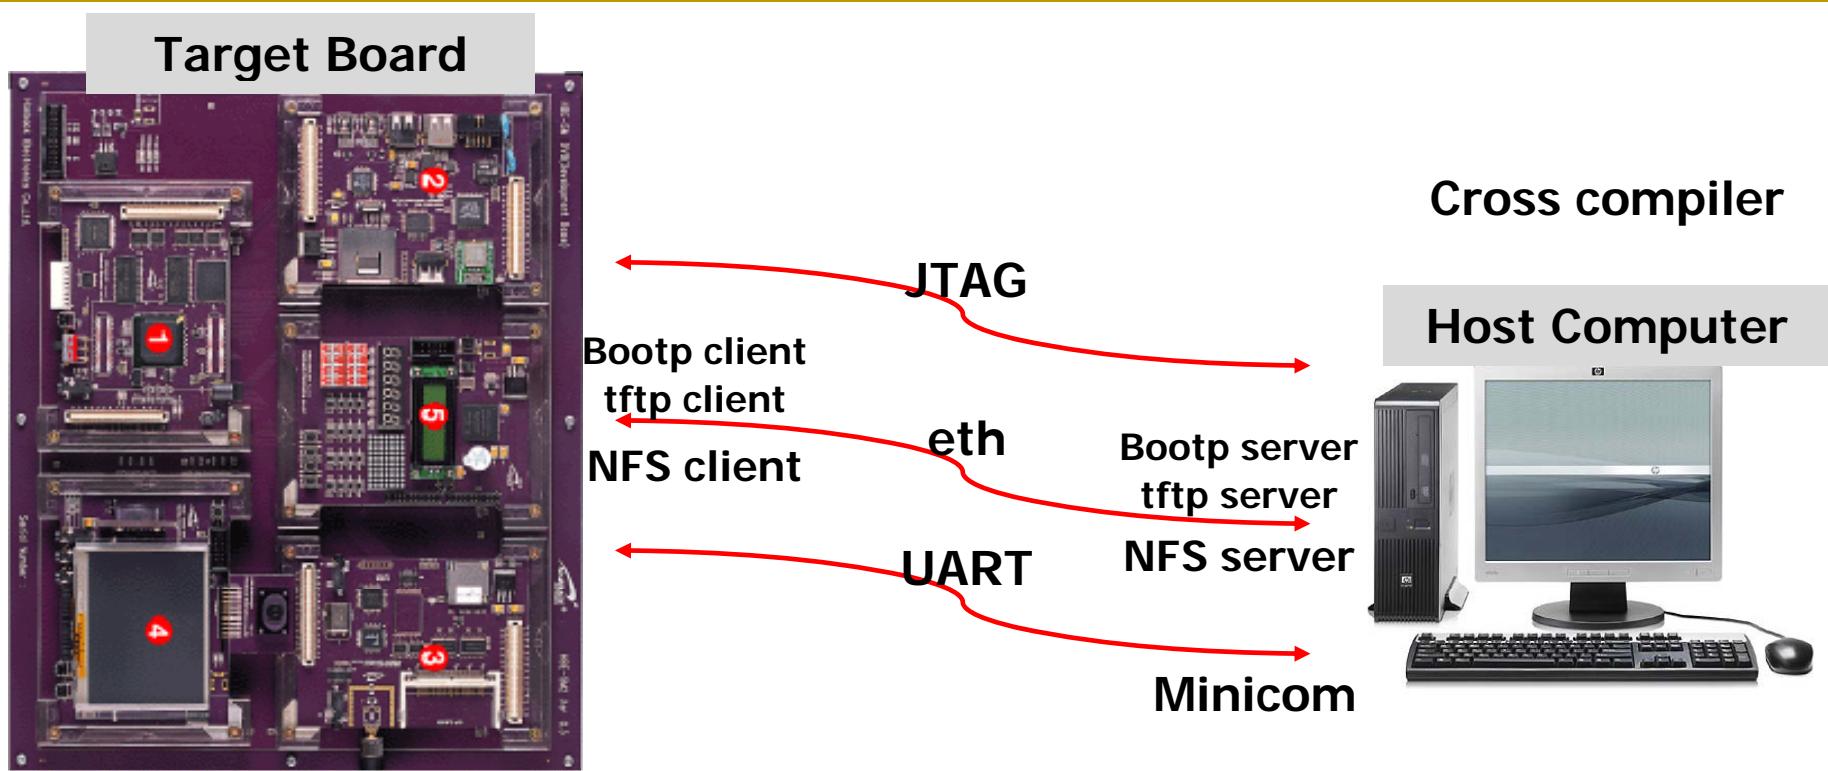

전체 구성도

Linux booting 확인

Step5: NFS

- Target board에서 Linux booting 후
 - ✓ Device driver 및 application 개발
- 매번 tftp로 download?

Step5: NFS

```

root's X desktop (localhost,localdomain:1)
root@localhost:/
파일(F) 편집(E) 보기(V) 터미널(T) 가기(G) 도움말(H)
[root@localhost /]# ls -a
. .automount boot etc lib root .
.. .fonts.cache-1 dev home lost+found opt sbin usr
.autofsck bin dev_board initrd misc proc tftpboot var
[root@localhost /]# mkdir nfs
[root@localhost /]# chmod 777 nfs
[root@localhost /]# ls -al | grep nfs
drwxrwxrwx 2 root root 4096 9월 11 16:43 nfs
[root@localhost /]# chown nobody nfs
[root@localhost /]# chgrp nobody nfs
[root@localhost /]# ls -al | grep nfs
drwxrwxrwx 2 nobody nobody 4096 9월 11 16:43 nfs
[root@localhost /]#

```

클라이언트로 부터의
마운트 요청시 서비스
할 디렉토리 생성

접근 권한 문제 등으로 인해
마운트가 실패하는 것을
방지하기 위한 설정

Step5: NFS

■ NFS환경 파일 수정

- ✓ /etc/exports 의 내용을 읽어 어떤 호스트에게 마운트를 허가하고, 어떤 제한을 둬야 하는지 판단

```
root's X desktop (localhost,localdomain:1)
root@localhost:/
```

/nfs	localhost(rw, insecure)	
/nfs	192.168.184.0/24(rw, insecure)	

NFS로 공유할 디렉토리

192.168.184대역은
모두 허용

rw : r(읽기), w(쓰기)허용
Insecure : 암호 인증 하지 않음

2,34-37 모두

Step5: NFS

```

root's X desktop (localhost,localdomain:1)
root@localhost:/
파일(F) 편집(E) 보기(V) 터미널(T) 가기(G) 도움말(H)
[root@localhost /]# ls -a
.automount boot etc lib mnt root tmp
.. fonts.cache-1 dev home lost+found opt sys user
.autofsck bin dev_board initrd misc proc
[root@localhost /]# mkdir nfs
[root@localhost /]# chmod 777 nfs
[root@localhost /]# ls -al | grep nfs
drwxrwxrwx 2 root root 4096 9월 11 16:43 nfs
[root@localhost /]# chown nobody nfs
[root@localhost /]# chgrp nobody nfs
[root@localhost /]# ls -al | grep nfs
drwxrwxrwx 2 nobody nobody 4096 9월 11 16:43 nfs
[root@localhost /]# vi /etc/exports
[root@localhost /]# service nfs restart
NFS mountd를 종료 중입니다:
NFS 데몬을 종료 중입니다:
Shutting down NFS quotas:
NFS 서비스를 종료 중입니다:
NFS 서비스를 시작하고 있습니다:
Starting NFS quotas:
NFS 데몬을 시작함:
NFS mountd를 시작하고 있습니다:
[root@localhost /]#

```

편집한 내용을 반영하기 위해서 nfs 데몬을 다시시작한다.
#/etc/rc.d/init.d/nfs restart

[실패]
[실패]
[실패]
[확인]

[확인]

데몬이 잘 작동 되는지 확인

Step5: NFS

■ Board에서 nfs서버 접속

```

root's X desktop (localhost,localdomain:1)
root@localhost:~#
파일(F) 편집(E) 보기(V) 터미널(T) 가기(G) 도움말(H)
[root@2410AMI mnt]$ ifconfig eth0
eth0      Link encap:Ethernet HWaddr 00:00:00:FF:EE:08
          inet addr:192.168.184.111 Bcast:192.168.184.255
          UP BROADCAST RUNNING MULTICAST MTU:1500
          RX packets:26 errors:0 dropped:0 overruns:0
          TX packets:28 errors:0 dropped:0 overruns:0
          collisions:0 txqueuelen:100
          RX bytes:3644 (3.5 KiB) TX bytes:0 (0.0 B)
          Interrupt:2 Base address:0x300

[root@2410AMI mnt]$ ifconfig eth0 down
[root@2410AMI mnt]$ ifconfig eth0 192.168.184.138 netmask 255.255.255.0
detected!! HALF
eth0: using half-duplex 10Base-T (RJ-45)
[root@2410AMI mnt]$ ifconfig eth0
eth0      Link encap:Ethernet HWaddr 00:00:00:FF:EE:08
          inet addr:192.168.184.138 Bcast:192.168.184.255 Mask:255.255.255.0
          UP BROADCAST RUNNING MULTICAST [root@2410AMI /]$ ls
          bin dev etc lib linuxrc lost+found mnt proc root sbin tmp usr var
          RX packets:26 errors:0 dropped:0 overruns:0
          TX packets:28 errors:0 dropped:0 overruns:0
          collisions:0 txqueuelen:100
          RX bytes:3644 (3.5 KiB) TX bytes:0 (0.0 B)
          Interrupt:2 Base address:0x300

[root@2410AMI ~]$ mkdir /mnt/nfs
[root@2410AMI ~]$ mount -t nfs -o nolock 192.168.184.1:/nfs /mnt/nfs

```

Target Board에서 Host에 NFS로
접속 하기 위하여 target의 IP를 설정.
Host NIC의 IP에 맞게 적절히
설정해줘야 함

nfs에 연결될
마운트 디렉토리

Step5: NFS

The image shows two terminal windows side-by-side. The top window is titled 'root's X desktop (localhost,localdomain:1)' and the bottom window is titled 'root@localhost:~'. Both windows have Korean labels for their menu bars.

Top Terminal (Host):

```
[root@localhost nfs]# ls -a  
[root@localhost nfs]# vi CanYouSeeMe?  
[root@localhost nfs]# ls -al  
합계 12  
drwxrwxrwx  2 root      root          4096  9월 11 18:47 .  
drwxr-xr-x  23 root     root          4096  9월 11 18:18 ..  
-rw-r--r--  1 root      root           53   9월 11 18:47 CanYouSeeMe?  
[root@localhost nfs]#
```

Bottom Terminal (Target Board):

```
[root@2410AMI /]$ cd /mnt/nfs  
[root@2410AMI nfs]$ ls -al  
total 9  
drwxrwxrwx  2 root      root          4096 Sep 11 2004 .  
drwxr-xr-x  4 root      root          1024 Jan  1 00:02 ..  
-rw-r--r--  1 root      root           53 Sep 11 2004 CanYouSeeMe?  
[root@2410AMI nfs]$
```

A red box highlights the file 'CanYouSeeMe?' in both lists. A yellow arrow points from the file in the bottom window to a yellow callout bubble containing the text:

Host에서 만든 파일이 target board에
서도 보이는 것을 확인 할 수 있다

Step5: NFS

The image shows two terminal windows side-by-side. The left window is titled 'root's X desktop (localhost,localdomain:1)' and the right window is titled 'root@localhost:~'.

Left Terminal (localhost:nfs):

```
[root@localhost nfs]# ls -a
.
..
[root@localhost nfs]# vi CanYouSeeMe?
[root@localhost nfs]# ls -al
합계 12
drwxrwxrwx    2 root      root          4096  9월 11 18:47 .
drwxr-xr-x   23 root      root          4096  9월 11 18:18 ..
-rw-r--r--    1 root      root           53   9월 11 18:47 CanYouSeeMe?
[root@localhost nfs]# 
```

Right Terminal (~):

```
[root@2410AMI /]$ cd /mnt/nfs
[root@2410AMI nfs]$ ls -al
total 9
drwxrwxrwx    2 root      root          1024 Sep 11 2004 .
drwxr-xr-x    4 root      root          1024 Jan  1 00:02 ..
-rw-r--r--    1 root      root           53 Sep 11 2004 CanYouSeeMe?
[root@2410AMI nfs]$ cd ..
[root@2410AMI mnt]$ pwd
/mnt
[root@2410AMI mnt]$ umount nfs
[root@2410AMI mnt]$ cd nfs
[root@2410AMI nfs]$ ls -al
total 2
drwxr-xr-x    2 root      root          1024 Jan  1 00:02 .
drwxr-xr-x    4 root      root          1024 Jan  1 00:02 ..
```

A yellow callout bubble points from the text 'CanYouSeeMe?' in the left terminal to the file entry in the right terminal. A red box highlights the command 'umount nfs' in the right terminal, and a black square marks the end of the command line.

Yellow Callout Text:

반대로, **umount** 한 후에는 **host**의 파일을 볼수 없게 된다

생각해 볼 사항

- Cross compiler가 없다면?
- 보드의 CD가 없다면?
