Contents

- From Chap 30~32 of the OSTEP
- Chap 30. Condition Variables
- Chap 31. Semaphores
- Chap 32. Common Concurrency Problems
- Chap 33. Event-based Concurrency
- Chap 34. Summary

(Source: https://www.crocus.co.kr/1261)

Chap. 30 Condition Variables

Locks

Mainly focusing on mutual exclusion

Condition variables

- Focusing on synchronization (not only mutual exclusion but also ordering)
- Specifically, used for checking whether a condition is true
 - E.g.: 1) whether a child has completed. 2) whether a buffer is filled

```
void *child(void *arg) {
        printf("child\n");
2
        // XXX how to indicate we are done?
        return NULL;
5
    int main(int argc, char *argv[]) {
        printf("parent: begin\n");
        pthread t c;
        Pthread_create(&c, NULL, child, NULL); // create child
        // XXX how to wait for child?
11
        printf("parent: end\n");
12
        return 0;
13
14
```

Figure 30.1: A Parent Waiting For Its Child

Chap. 30 Condition Variables

Feasible solution 1: busy waiting with a variable

```
volatile int done = 0;
2
    void *child(void *arg) {
3
        printf("child\n");
        done = 1;
        return NULL;
7
8
    int main (int argc, char *argv[]) {
9
        printf("parent: begin\n");
10
        pthread t c;
11
        Pthread create (&c, NULL, child, NULL); // create child
12
        while (done == 0)
13
            ; // spin
14
        printf("parent: end\n");
15
        return 0;
16
17
```

Figure 30.2: Parent Waiting For Child: Spin-based Approach

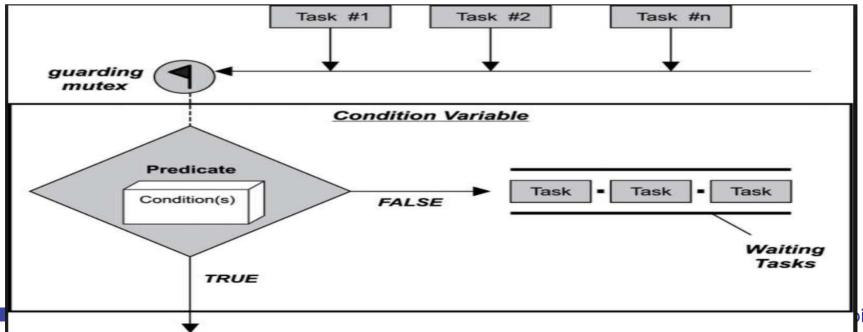

✓ Generally work, but inefficient (waste CPU time), sometimes incorrect on multiple children case

30.1 Definition and Routines

Feasible solution 2: condition variable

- ✓ An explicit queue that threads can put themselves on when some state of execution (i.e., some condition) is not as desired
- Some other thread, when it changes state, can then wake one (or more) of those waiting threads and thus allow them to continue.
- √ pthread APIs

```
pthread_cond_wait(pthread_cond_t *c, pthread_mutex_t *m);
pthread_cond_signal(pthread_cond_t *c);
```

i, DKU

30.1 Definition and Routines

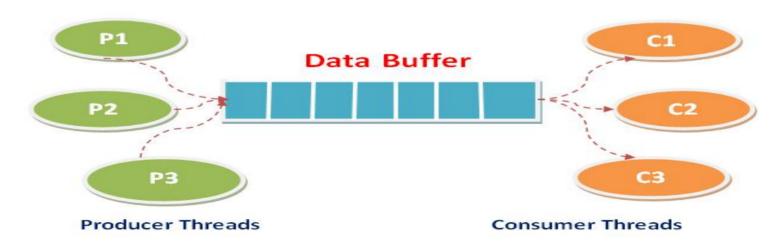

- Feasible solution 2: condition variable
 - Condition variable example

```
int done = 0;
    pthread_mutex_t m = PTHREAD_MUTEX_INITIALIZER;
    pthread_cond_t c = PTHREAD_COND_INITIALIZER;
3
4
5
    void thr exit() {
6
        Pthread mutex lock (&m);
7
         done = 1;
        Pthread cond signal (&c);
        Pthread mutex unlock (&m);
    }
10
11
12
    void *child(void *arg) {
         printf("child\n");
13
        thr exit();
14
15
        return NULL;
    1
16
17
18
    void thr_join() {
        Pthread_mutex_lock(&m);
19
         while (done == 0)
             Pthread_cond_wait(&c, &m);
21
        Pthread mutex unlock (&m);
22
23
24
25
    int main(int argc, char *argv[]) {
         printf("parent: begin\n");
26
27
        pthread_t p;
        Pthread_create(&p, NULL, child, NULL);
28
         thr_join();
        printf("parent: end\n");
30
        return 0;
31
```

Figure 30.3: Parent Waiting For Child: Use A Condition Variable

Note: 1) wait(): unlock/lock implicitly, 2) while instead of if in join()

- The famous Producer/Consumer problem (also known as bounded buffer problem)
 - ✓ Scenario
 - Producers generate data items and place them in a buffer
 - Consumers grab the items from the buffer and consume them
 - e.g. DB server, streaming server, pipe, cache, ...
 - ✓ Issue
 - Mutual exclusion
 - Empty case: no data (need condition check)
 - Full case: no available buffer (need condition check)

- Basic structure: without considering sharing
 - ✓ Shared buffer: put(), get() interfaces
 - Assumption: space for only one item (single buffer) → relax later
 - Producer/Consumer: producer(), consumer()

```
int buffer;
   int count = 0; // initially, empty
                                                        count
  void put (int value) (
        assert (count == 0);
        count = 1:
        buffer = value;
                                                        buffer
   int get() (
100
        assert (count == 1);
       count = 0;
        return buffer;
1.3
14
                Figure 30.6: The Put And Get Routines (v1)
   void *producer(void *arg) {
       int i:
2
       int loops = (int) arg;
       for (i = 0; i < loops; i++) {
           put(i);
7
   void *consumer(void *arg) (
       while (1)
3.0
           int tmp = get();
3.3
           printf("%d\n", tmp);
13
              Figure 30.7: Producer/Consumer Threads (v1)
```

Solution 1: Now consider sharing

- ✓ Mutual exclusion: mutex
- Ordering: condition variable

```
int loops; // must initialize somewhere...
   cond t cond;
   mutex t mutex;
   void *producer(void *arg) (
      int i:
       for (i = 0; i < loops; i++) (
           Pthread mutex lock (&mutex);
                                                      pl
           if (count == 1)
                                                       p2
                Pthread cond wait (&cond, &mutex); //
                                                    // p4
           put(i);
           Pthread cond signal (&cond);
                                                    // p5
           Pthread_mutex_unlock(&mutex);
                                                    // p6
14
15
16
   void *consumer(void *arg) (
17
       int i:
       for (i = 0; i < loops; i++) {
           Pthread mutex lock (&mutex);
                                                    // cl
           if (count == 0)
2.0
                Pthread_cond_wait(&cond, &mutex); // c3
           int tmp = get();
                                                    // c4
           Pthread_cond_signal(&cond);
                                                    // c5
           Pthread_mutex_unlock(&mutex);
                                                    // c6
25
           printf("%d\n", tmp);
```

Figure 30.8: Producer/Consumer: Single CV And If Statement

Is it correct?

count

buffer

Solution 1 (cont')

√ Wake up C1, but run C2

```
void *producer(void *arg) {
void *consumer(void *arg) (
                                                                       int i;
    for (i = 0; i < loops; i++) (
                                                                        for (i = 0; i < loops; i++) {
        Pthread mutex lock (&mutex);
                                                                           Pthread_mutex_lock(&mutex);
                                                                                                                // pl
        if (count == 0)
                                                 // c2
                                                                           if (count == 1)
            Pthread cond wait (&cond, &mutex); // c3
                                                                               Pthread_cond_wait(&cond, &mutex); // p3
        int tmp = get();
                                                                           put(i);
                                                 // c5
        Pthread_cond_signal(&cond);
                                                                           Pthread cond signal (&cond);
        Pthread mutex_unlock(&mutex);
                                                                           Pthread mutex unlock (&mutex);
        printf("%d\n", tmp);
```

Figure 30.9: Thread Trace: Broken Solution (v1)

Solution 2

✓ while instead of if

```
int loops;
   cond t cond;
   mutex t mutex;
   void *producer(void *arg) (
        int i;
       for (i = 0; i < loops; i++) (
2
            Pthread mutex lock (&mutex);
                                                       // pl
            while (count == 1)
                Pthread cond wait (&cond, &mutex); // p3
100
                                                       // p4
            put(i);
3.3
            Pthread cond signal (&cond);
                                                       // p5
            Pthread mutex_unlock(&mutex);
                                                       // p6
13
14
15
166
   void *consumer(void *arg) [
117
       int i;
1.6
        for (i = 0; i < loops; i++) (
            Pthread_mutex_lock(&mutex);
                                                       II cI
**2000
            while (count == 0)
                                                       // c2
21
                Pthread cond wait (&cond, &mutex); // c3
199
            int tmp = get();
                                                       // c4
                                                       // c5
            Pthread_cond_signal(&cond);
24
            Pthread mutex unlock (&mutex);
                                                       // c6
25
            printf("%d\n", tmp);
27
28
```

Figure 30.10: Producer/Consumer: Single CV And While

Now, is it correct?

Solution 2 (cont')

✓ Signal to P, but wake up C2

16	void *consumer(void *arg) {			4	void *producer(void *arg) {	
17	int i;			5	int i;

Solution 3 (final)

- ✓ Two condition variables
 - Indicate explicitly which thread I want to send my signal.

```
cond_t
             empty, fill;
1
2
    mutex t mutex;
3
    void *producer(void *arg) {
4
        int i;
5
        for (i = 0; i < loops; i++) {
             Pthread mutex lock (&mutex);
             while (count == 1)
                 Pthread_cond_wait(&empty, &mutex);
10
             put(i);
             Pthread_cond_signal(&fill);
11
             Pthread mutex unlock (&mutex);
12
13
    }
14
15
    void *consumer(void *arg) {
16
        int i;
17
        for (i = 0; i < loops; i++) {
18
             Pthread mutex lock (&mutex);
19
             while (count == 0)
20
                 Pthread_cond_wait(&fill, &mutex);
21
             int tmp = get();
22
             Pthread_cond_signal(&empty);
23
             Pthread_mutex_unlock(&mutex);
24
             printf("%d\n", tmp);
25
26
27
```

Figure 30.12: Producer/Consumer: Two CVs And While

Multiple buffers cases: final solution

```
1
    int buffer[MAX];
    int fill ptr = 0;
    int use ptr = 0;
3
    int count
5
    void put (int value) {
6
        buffer[fill ptr] = value;
7
        fill_ptr = (fill_ptr + 1) % MAX;
8
9
        count++;
10
11
    int get() {
12
        int tmp = buffer[use ptr];
13
        use_ptr = (use_ptr + 1) % MAX;
14
        count --;
        return tmp;
16
```

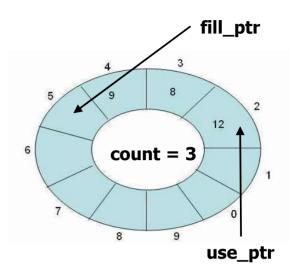

Figure 30.13: The Correct Put And Get Routines

```
cond_t empty, fill;
1
2
    mutex_t mutex;
3
    void *producer(void *arg) {
        int i;
5
        for (i = 0; i < loops; i++) {
            Pthread_mutex_lock(&mutex);
                                                      // p1
            while (count == MAX)
                                                     // p2
                Pthread cond wait (&empty, &mutex); // p3
9
10
            put(i);
                                                     // p4
            Pthread_cond_signal(&fill);
                                                     // p5
            Pthread_mutex_unlock(&mutex);
                                                     // p6
12
13
14
15
    void *consumer(void *arg) {
16
        int i;
17
        for (i = 0; i < loops; i++) {
18
            Pthread_mutex_lock(&mutex);
                                                      // cl
19
            while (count == 0)
                                                      // c2
20
                Pthread_cond_wait(&fill, &mutex); // c3
21
                                                      // c4
            int tmp = get();
22
            Pthread_cond_signal(&empty);
                                                     // c5
23
            Pthread_mutex_unlock(&mutex);
            printf("%d\n", tmp);
25
26
```

Quiz for 6th-Week 2nd-Lesson

Quiz

- ✓ 1. Explain the three issues that we need to consider for the producer/consumer problem.
- ✓ 2. Describe whether the below program is correct or not? If incorrect, discuss why?
- ✓ Due: until 6 PM Friday of this week (15th, April)

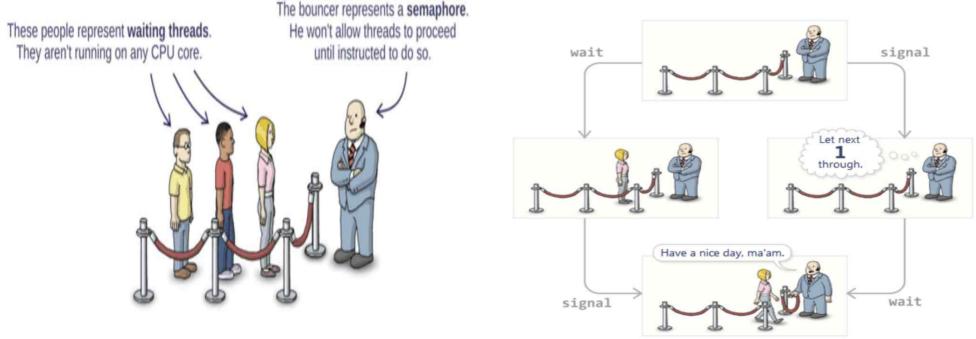

```
int loops; // must initialize somewhere...
  cond_t cond;
  mutex t mutex;
  void *producer(void *arg) (
       int i;
       for (i = 0; i < loops; i++) {
          Pthread mutex lock (&mutex);
                                                  // pl
           if (count == 1)
                                                  // p2
               Pthread cond wait (&cond, &mutex); // p3
                                                  // p4
           put(i);
                                                  // p5
           Pthread cond signal (&cond);
           Pthread_mutex_unlock(&mutex);
                                                  // p6
16
  void *consumer(void *arg) (
       int i;
       for (i = 0; i < loops; i++) (
                                                  // cl
           Pthread_mutex_lock(&mutex);
          if (count == 0)
               Pthread_cond_wait(&cond, &mutex); // c3
           int tmp = get();
                                                  // c4
           Pthread_cond_signal(&cond);
                                                  // c5
           Pthread_mutex_unlock(&mutex);
                                                 // c6
           printf("%d\n", tmp);
```

Figure 30.8: Producer/Consumer: Single CV And If Statement

Chap 31. Semaphores

Semaphore

- ✓ Well-known structure for concurrency control
 - Can be used as both a lock and a condition variable
 - Binary semaphore, Counting semaphore
 - Can be employed by various concurrency problems including
 1) producer/consumer, 2) reader/writer and 3) dining philosophers
- ✓ Invented by the famous Edsger Dijkstra

(Source: http://preshing.com/20150316/semaphores-are-surprisingly-versatile/)

31.1 Semaphores: A Definition

Semaphore definition

- An object with an integer value manipulated by three routines
 - sem_init(semaphore, p_shared, initial_value)
 - sem_wait(): also called as P(), down() ...
 - Decrease the value of the semaphore (S). Then, either return right away (when S >= 0) or cause the caller to suspend execution waiting for a subsequent post (when S < 0)
 - sem_post(): also called as V(), up(), sem_signal() ...
 - Increment the value of the semaphore and then, if there is a thread waiting to be woken, wakes one of them up
 - Others: sem_trywait(), sem_timewait(), sem_destroy()

```
#include <semaphore.h>
sem_t s;
sem_init(&s, 0, 1);

Figure 31.1: Initializing A Semaphore
```

```
int sem_wait(sem_t *s) {
    decrement the value of semaphore s by one
    wait if value of semaphore s is negative
}

int sem_post(sem_t *s) {
    increment the value of semaphore s by one
    if there are one or more threads waiting, wake one
}
```

Figure 31.2: Semaphore: Definitions Of Wait And Post

31.2 Binary Semaphores (Locks)

Using a semaphore as a lock

```
sem_t m;
sem_init(&m, 0, X); // initialize semaphore to X; what should X be?

sem_wait(&m);
// critical section here
sem_post(&m);
```

Figure 31.3: A Binary Semaphore (That Is, A Lock)

- Running example
 - Can support the mutual exclusion
 - Note that the value of the semaphore, when negative, is equal to the number of waiting threads

Value	Thread 0	State	Thread 1	State
1		Running		Ready
1	call sem_wait()	Running		Ready
0	sem_wait() returns	Running		Ready
0	(crit sect: begin)	Running		Ready
0	Interrupt; Switch \rightarrow T1	Ready		Running
0		Ready	call sem_wait()	Running
-1		Ready	decrement sem	Running
-1		Ready	$(sem < 0) \rightarrow sleep$	Sleeping
-1		Running	$Switch \rightarrow T0$	Sleeping
-1	(crit sect: end)	Running		Sleeping
-1	call sem_post()	Running		Sleeping
0	increment sem	Running		Sleeping
O	wake(T1)	Running		Ready
0	sem_post() returns	Running		Ready
0	Interrupt; Switch \rightarrow T1	Ready		Running
0	•	Ready	sem_wait() returns	Running
0		Ready	(crit sect)	Running
0		Ready	call sem_post()	Running
1		Ready	sem_post() returns	Running

Figure 31.5: Thread Trace: Two Threads Using A Semaphore

31.3 Semaphores for Ordering

- Using a semaphore as a conditional variable
 - ✓ Initial semaphore value: 0 (note: it is initialized as 1 for mutex)

```
sem t s;
1
2
    void *
3
    child(void *arg) {
        printf("child\n");
5
        sem_post(&s); // signal here: child is done
6
        return NULL;
9
    int
10
    main(int argc, char *argv[]) {
11
        sem_init(&s, 0, X); // what should X be?
12
        printf("parent: begin\n");
13
        pthread_t c;
14
        Pthread_create(&c, NULL, child, NULL);
15
        sem_wait(&s); // wait here for child
16
        printf("parent: end\n");
17
        return 0;
18
19
```

Figure 31.6: A Parent Waiting For Its Child

Compare semaphore (this page) with condition variable (page 6) → No "Done" variable

- Using a semaphore for the producer/consumer problem
 - ✓ mutex: binary semaphore, full/empty: counting semaphore

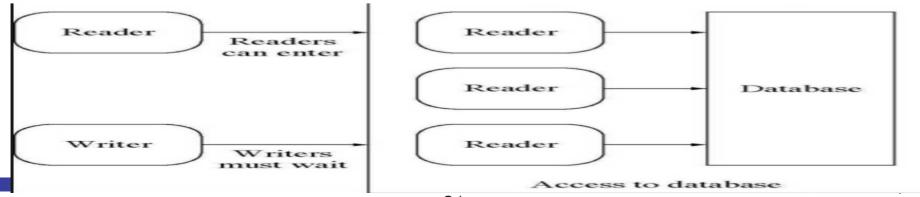

```
int buffer[MAX];
      int fill = 0;
  2
  3
      int use = 0;
      void put (int value) {
                                    // Line F1
          buffer[fill] = value;
          fill = (fill + 1) % MAX; // Line F2
  7
  8
  9
      int get() {
 10
                                       // Line G1
 11
          int tmp = buffer[use];
                                       // Line G2
 12
          use = (use + 1) % MAX;
 13
          return tmp;
                        Figure 31.9: ☐ ✓ Summary of two versions (semaphore in
 14
    sem_t empty;
                                          page 20 vs condition variable in page 14)
1
    sem_t full;
2
    sem_t mutex;
3
                                              1) No count variable (owing to counting semaphore)
                                              2) ordering → mutex vs mutex → ordering (See
    void *producer(void *arg) {
        int i;
                                              page 40)
        for (i = 0; i < loops; i++)
            sem_wait(&empty);
                                          // Line P1.5 (MOVED MUTEX HERE...)
            sem_wait(&mutex);
9
10
            put(i);
                                          // Line P2
            sem_post(&mutex);
                                          // Line P2.5 (... AND HERE)
11
            sem_post(&full);
                                          // Line P3
12
13
14
15
    void *consumer(void *arg) {
16
17
        int i;
18
        for (i = 0; i < loops; i++) {
            sem_wait(&full);
                                          // Line C1
19
                                          // Line C1.5 (MOVED MUTEX HERE...)
            sem_wait(&mutex);
                                          // Line C2
            int tmp = get();
21
                                          // Line C2.5 (... AND HERE)
            sem_post(&mutex);
23
                                          // Line C3
            sem_post(&empty);
            printf("%d\n", tmp);
        }
25
26
27
    int main(int argc, char *argv[]) {
29
30
        sem_init(&empty, 0, MAX); // MAX buffers are empty to begin with...
        sem_init(&full, 0, 0); // ... and 0 are full
        sem_init(&mutex, 0, 1); // mutex=1 because it is a lock
32
        // ...
33
```

Figure 31.12: Adding Mutual Exclusion (Correctly)

31.5 Reader-Writer Locks

Producer/Consumer vs. Reader/Writer

- ✓ Producer/Consumer: need mutual exclusion (e.g. list insert/delete)
- Reader/Writer: need mutual exclusion, but allow multiple readers (e.g. tree lookup and insert)
 - Specific comparison
 - A Producer or Consumer in Critical Section → next Producer or Consumer must wait
 - A writer in Critical Section → 1) next writer or 2) next reader must wait
 - A reader in Critical Section → 1) next writer must wait, 2) but next reader can enter (better performance)
 - Issue (related to starvation)
 - Readers in Critical Section + a writer is waiting → a reader arrives : wait or allowed (depending on either writer preference or reader preference)

31.5 Reader-Writer Locks

Implementation for reader/writer

- ✓ lock: for mutual exclusion on readers
- writelock: to allow a write or multiple readers
 - The below implementation prefer readers (writers can starve)

```
1
    typedef struct _rwlock_t {
                        // binary semaphore (basic lock)
2
      sem_t lock;
      sem_t writelock; // used to allow ONE writer or MANY readers
3
             readers; // count of readers reading in critical section
    } rwlock_t;
5
7
    void rwlock_init(rwlock_t *rw) {
8
      rw->readers = 0;
      sem_init(&rw->lock, 0, 1);
10
      sem init (&rw->writelock, 0, 1);
11
12
    void rwlock_acquire_readfock(rwfock_t *rw) {
13
      sem wait (& rw->lock);
14
      rw->readers++;
15
16
      if (rw-xreaders == 1)
        sem_wait(&rw->writelock); // first reader acquires writelock
17
      sem_post(&rw->lock);
18
19
20
21
    void rwlock release readlock (rwlock t *rw) {
22
      sem_wait(&rw->lock);
      rw->readers--;
      if (rw->readers == 0)
        sem_post(&rw->writelock); // last reader releases writelock
      sem_post(&rw->lock);
26
27
        w1 w2
                                w1
28
    void rwlock_acquire_writeldck(rwlock_t *rw) {
29
30
      sem_wait(&rw->writelock);
31
32
    void rwlock_release_writelock(rwlock_t *rw) {
33
34
      sem_post(&rw->writelock);
35
```

Figure 31.13: A Simple Reader-Writer Lock

31.6 The Dining Philosophers

Problem definition

- ✓ There are five "philosophers" sitting around a table.
- ✓ Between each pair of philosophers is a single fork (thus, five total)
- The philosophers each have times for thinking or for eating
- ✓ In order to eat, a philosopher needs two forks, both the one on their left and the one on their right → shared resource → concurrency

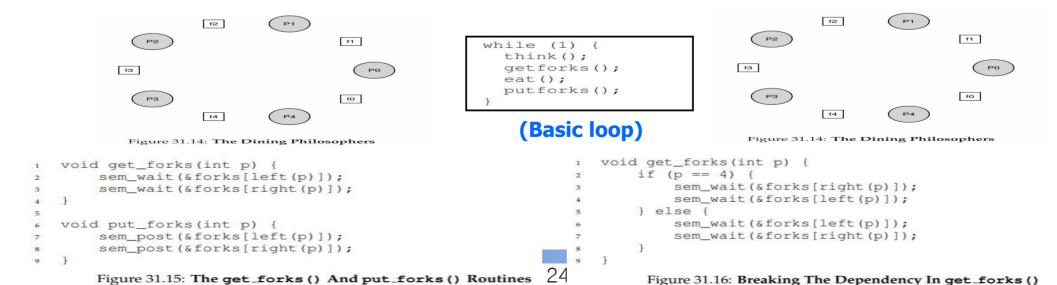

31.6 The Dining Philosophers

Solution

- ✓ Basic loop for each philosopher
- Now question is how to implement getforks() and putforks()
 - Using five semaphores: sem_t forks[5]
 - Obtain semaphore before acquire a fork
- ✓ Cause Deadlock
 - All philosophers obtain their left fork, while waiting their right one
 - How to avoid this issue?

New Solutions

- ✓ 1) break ordering, 2) set limit, 3) employ transaction (e.g. the Monitor),
 - 4) more resource, 5) teach philosophers (idea from a student)

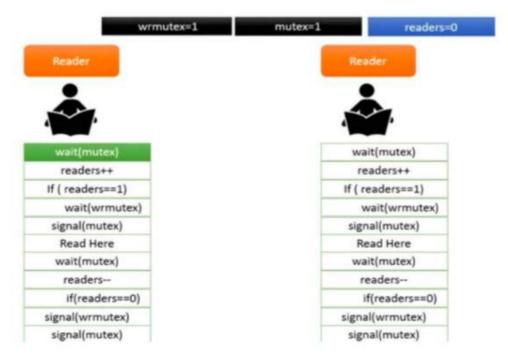

Quiz for 7th-Week 1st-Lesson

Quiz

- ✓ 1. Explain the meaning of semaphore value in Figure 31.5. Is it possible that this value becomes -2?
- ✓ 2. Discuss the differences between the producer/consumer and reader/writer problem (at lease 2 differences).
- ✓ Due: until 6 PM Friday of this week (22th, April)

Value	Thread 0	State	Thread 1	State
1		Running		Ready
1	call sem_wait()	Running		Ready
0	sem_wait() returns	Running		Ready
0	(crit sect: begin)	Running		Ready
0	Interrupt; Switch \rightarrow T1	Ready		Running
0		Ready	call sem_wait()	Running
-1		Ready	decrement sem	Running
-1		Ready	$(sem<0) \rightarrow sleep$	Sleeping
-1		Running	$Switch \rightarrow T0$	Sleeping
-1	(crit sect: end)	Running		Sleeping
-1	call sem_post()	Running		Sleeping
0	increment sem	Running		Sleeping
0	wake(T1)	Running		Ready
0	sem_post() returns	Running		Ready
0	Interrupt; Switch \rightarrow T1	Ready		Running
0		Ready	sem_wait() returns	Running
0		Ready	(crit sect)	Running
0		Ready	call sem_post()	Running
1		Ready	sem_post() returns	Running

Figure 31.5: Thread Trace: Two Threads Using A Semaphore

(Source: www.chegg.com/)

Chap 32. Common Concurrency Problems

Concurrency

- ✓ Pros: can enhance throughput via processing in parallel
- Cons: may cause several troublesome concurrency bugs (a.k.a. timing bugs)

32.1 What Types of Concurrency Bugs Exist?

Application	What it does	Non-Deadlock	Deadlock
MySQL	Database Server	14	9
Apache	Web Server	13	4
Mozilla	Web Browser	41	16
OpenOffice	Office Suite	6	2
Total		74	31

Figure 32.1: Bugs In Modern Applications

- ✓ Total bugs: 105
 - Deadlock bugs: 31
 - Non-deadlock bugs : 74
- ✓ Differ among applications

32.2 Non-Deadlock Bugs

- Two major types of non-deadlock bugs
 - ✓ Atomicity-Violation Bugs (From MySQL sources)

```
1 Thread 1::
2  if (thd->proc_info) {
3     ...
4     fputs(thd->proc_info, ...);
5     ...
6  }
7
8 Thread 2::
9 thd->proc_info = NULL;
```

✓ Order-Violation Bugs

32.2 Non-Deadlock Bugs

Solution to Atomicity-Violation Bugs

```
pthread_mutex_t proc_info_lock = PTHREAD_MUTEX_INITIALIZER;
1
2
3
    Thread 1::
4
    pthread_mutex_lock(&proc_info_lock);
5
    if (thd->proc_info) {
6
7
      fputs(thd->proc_info, ...);
8
9
    pthread_mutex_unlock(&proc_info_lock);
10
11
12
    Thread 2::
    pthread_mutex_lock(&proc_info_lock);
13
    thd->proc_info = NULL;
14
    pthread_mutex_unlock(&proc_info_lock);
15
```

32.2 Non-Deadlock Bugs

Solution to Order-Violation Bugs

```
pthread_mutex_t mtLock = PTHREAD_MUTEX_INITIALIZER;
1
    pthread cond t mtCond = PTHREAD COND INITIALIZER;
2
    int mtInit
3
                             = 0:
4
    Thread 1::
5
    void init() {
6
7
       mThread = PR CreateThread(mMain, ...);
8
9
       // signal that the thread has been created ...
10
       pthread_mutex_lock(&mtLock);
11
       mtInit = 1;
12
       pthread cond signal (&mtCond);
13
       pthread_mutex_unlock(&mtLock);
14
15
16
17
18
    Thread 2::
19
    void mMain(...) {
20
        // wait for the thread to be initialized ...
21
22
        pthread_mutex_lock(&mtLock);
        while (mtInit == 0)
23
             pthread cond_wait(&mtCond, &mtLock);
24
        pthread_mutex_unlock(&mtLock);
25
26
        mState = mThread->State;
27
28
         . . .
```

pthread_cond_wait(): unlock and lock mutex implicitly before and after sleep (see page 6)

Deadlock

A situation where two or more threads wait for events that never occur

```
Thread 1: Thread 2: pthread_mutex_lock(L1); pthread_mutex_lock(L2); pthread_mutex_lock(L2);
```

 E.g.) When a thread (say Thread 1) is holding a lock (L1) and waiting for another one (L2); unfortunately, the thread (Thread 2) that holds lock L2 is waiting for L1 to be released.

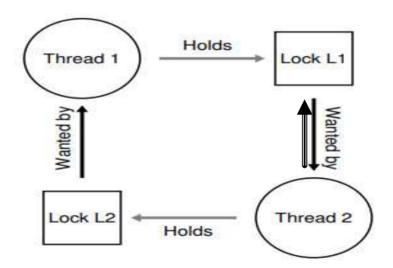

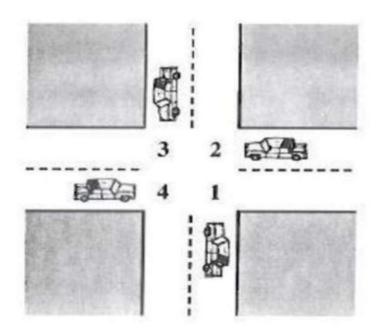

Figure 32.7: The Deadlock Dependency Graph

Deadlock: 4 Conditions

- ✓ Mutual exclusion
- ✓ Hold-and-Wait
- ✓ No preemption for resource
- ✓ Circular wait

(a) Deadlock Possible

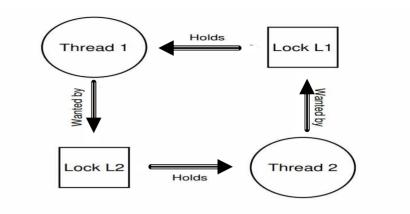

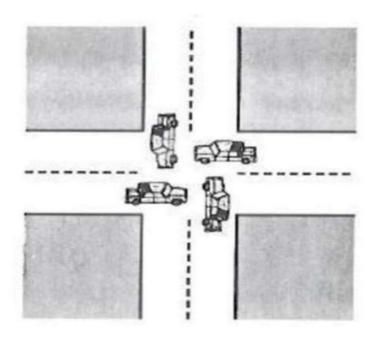

Figure 32.2: The Deadlock Dependency Graph

(b) Deadlock

- How to handle Deadlock: three strategies
 - ✓ 1. Deadlock Prevention
 - ✓ 2. Deadlock Avoidance via Scheduling
 - ✓ 3. Deadlock Detection and Recovery

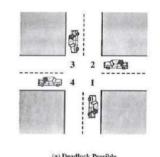

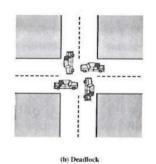

Approach	Resource Allocation Policy	Different Schemes	Major Advantages	Major Disadvantages	
		Requesting all resources at once	Works well for processes that perform a single burst of activity No preemption necessary	Inefficient Delays process initiation Future resource requirements must be known by processes	
Prevention	Conservative; undercommits resources	undercommits applied to resources		applied to resources whose state can be saved and restored	•Preempts more often than necessary
		Resource ordering	Feasible to enforce via compile-time checks Needs no run-time computation since problem is solved in system design	•Disallows incremental resource requests	
Avoidance	Midway between that of detection and prevention	Manipulate to find at least one safe path	•No preemption necessary	Puture resource requirements must be known by OS Processes can be blocked for long periods	
Detection	Very liberal; requested resources are granted where possible	Invoke periodically to test for deadlock	Never delays process initiation Facilitates online handling	•Inherent preemption losses	

(Source: "Operating systems: Internals and Design Principle" by W. Stalling)

Deadlock prevention

- ✓ This strategy seeks to prevent one of the 4 Deadlock conditions
- √ 1. Hold-and-wait
 - Acquire all locks at once, atomically
- ✓ 2. No Preemption
 - Release lock if it can not hold another lock

- Concern: 1) may cause Livelock, 2) sometimes require undo
 - Two threads could both be repeatedly attempting this sequence and repeatedly failing to acquire both locks → add random delay
- ✓ 3. Circular Wait
 - A total ordering on lock acquisition
 - E.g.) The comment at the top of the source code in Linux: "i_mutex" before i_mmap_mutex"

```
pthread_mutex_lock(prevention); // begin lock acquistion
pthread_mutex_lock(L1);
pthread_mutex_lock(L2);
pthread_mutex_lock(L2);
pthread_mutex_unlock(L2);
pthread_mutex_unlock(prevention); // end
pthread_mutex_unlock(L1);
pthread_mutex_unlock(prevention); // end
pthread_mutex_unlock(L1);
pthread_mutex_unlock(prevention); // end
```

(Acquire all locks atomically)

(Release lock if it can not hold another lock)

- Deadlock prevention (cont')
 - ✓ 4. Mutual Exclusion:
 - "lock free" approach: no lock but support mutual exclusion
 - Using powerful hardware instructions, we can build data structures in a manner that does not require explicit locking
 - Atomic integer operation with compare-and-swap (chapter 28.9 in LN 4)

```
void increment(counter_t *c) {
    Pthread_mutex_lock(&c->lock);
    c->value++;
    Pthread_mutex_unlock(&c->lock);
}
Using Lock
```

```
void AtomicIncrement(int *value, int amount) {
do {
  int old = *value;
} while (CompareAndSwap(value, old, old + amount) == 0);
}
Lock free
```

List management (39 page in LN4)

```
void insert(int value) {
node_t *n = malloc(sizeof(node_t));
assert(n != NULL);
n->value = value;
n->next = head;
head = n;
}
```

Using Lock

Lock free

```
void insert(int value) {
   node_t *n = malloc(sizeof(node_t));
   assert(n != NULL);
   n->value = value;
   pthread_mutex_lock(listlock); // begin critical section   n->next = head;
   head = n;
   pthread_mutex_unlock(listlock); // end critical section
}
```

```
void insert(int value) {
   node_t *n = malloc(sizeof(node_t));
   assert(n != NULL);
   n->value = value;
   do {
      n->next = head;
   } while (CompareAndSwap(&head, n->next, n) == 0);
}
```

Lock free: applicable only soned specific cases vs Lock: general

Deadlock Avoidance via Scheduling

- ✓ Instead of prevention, try to avoid by scheduling threads in a way as to guarantee no deadlock can occur.
 - E.g.) two CPUs, four threads, T1 wants to use L1 and L2, T2 also wants both, T3 wants L1 only, T4 wants nothing

E.g. 2) more contention (negative for load balancing)

■ No deadlock, but under-utilization → A conservative approach

- Deadlock Avoidance via Scheduling (cont')
 - ✓ Famous algorithm: Banker's algorithm
 - E.g.) Multiple processes with single resource case (also applicable to multiple resources case)

	Has	Max		Has	Max	
Α	0	5	Α	2	5	A
В	0	6	В	0	6	E
С	0	3	С	1	3	C
D	0	7	D	5	7	

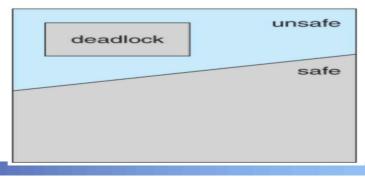

HasMaxA25B16C13D57

Initial State: Free =10

State 1: Free = 2

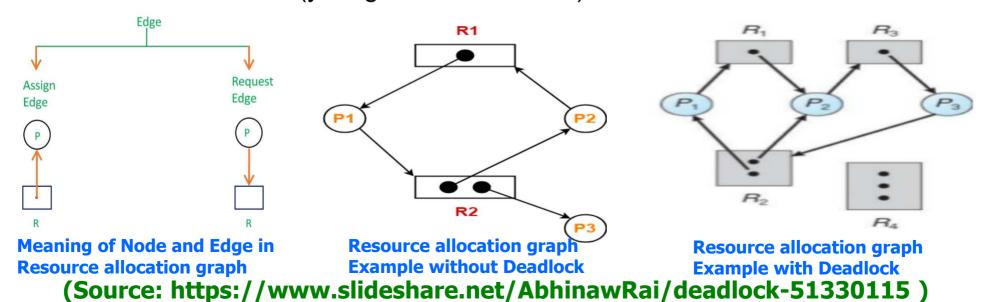

State 2: Free =1

- Safe and unsafe state
 - Try to stay in safe state while allocating resources

Deadlock Detection and Recovery

- Allow deadlocks to occasionally occur, and then take a detection and recovery action
 - E.g.) If an OS froze once a year, you would just reboot it (but failure is a norm in a Cloud/Bigdata platform)
 - Many DB systems employ active deadlock detection approach
- ✓ How to detect?
 - Periodically, build resource allocation graph, checking in for cycles
- ✓ How to recovery?
 - Select a victim (youngest or least locks)

J. Choi. DKU

32.4 Summary

Concurrency method

- ✓ Lock, Condition variable, Semaphore, ...
- Well-known concurrency problems
 - ✓ The Producer/Consumer problem
 - ✓ The Reader/Writer problem
 - ✓ The Dining philosopher problem

Concurrency bugs

- ✓ Non-Deadlock bugs
- ✓ Deadlock bugs
- Deadlock approach
 - ✓ Prevention strategy
 - ✓ Avoidance strategy
 - Detection and Recovery strategy

TIP: DON'T ALWAYS DO IT PERFECTLY (TOM WEST'S LAW)

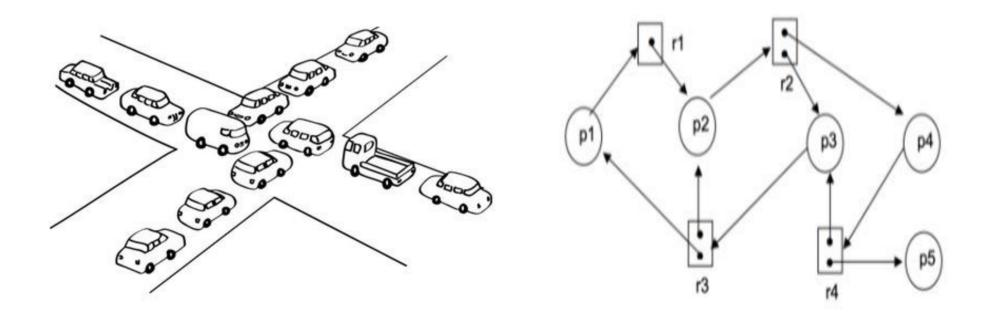

Tom West, famous as the subject of the classic computer-industry book *Soul of a New Machine* [K81], says famously: "Not everything worth doing is worth doing well", which is a terrific engineering maxim. If a bad thing happens rarely, certainly one should not spend a great deal of effort to prevent it, particularly if the cost of the bad thing occurring is small. If, on the other hand, you are building a space shuttle, and the cost of something going wrong is the space shuttle blowing up, well, perhaps you should ignore this piece of advice.

Quiz for 7th-Week 2nd-Lesson

Quiz

- ✓ 1. Explain how to prevent deadlock. (4 mechanisms in the deadlock prevention strategy)
- ✓ 2. Is there a deadlock in the below right resource allocation graph?
- ✓ Due: until 6 PM Friday of this week (22th, April)

Appendix 1

31.4 Producer/Consumer (Bounded Buffer) Problem

Second attempt: Adding mutual exclusion

```
sem_t empty;
    sem t full;
    sem t mutex;
4
    void *producer(void *arg) {
5
        int i;
6
        for (i = 0; i < loops; i++) {
             sem wait (&mutex);
                                           // Line PO (NEW LINE)
             sem_wait(&empty);
                                           // Line P1
             put(i);
                                           // Line P2
10
             sem post (&full);
                                           // Line P3
11
                                           // Line P4 (NEW LINE)
             sem post (&mutex);
12
13
    }
14
15
    void *consumer(void *arg) {
16
17
        int i;
        for (i = 0; i < loops; i++) {
18
                                           // Line CO (NEW LINE)
             sem wait (&mutex);
19
             sem wait (&full);
                                          // Line C1
20
             int tmp = get();
                                           // Line C2
21
             sem_post(&empty);
                                          // Line C3
22
             sem post (&mutex);
                                           // Line C4 (NEW LINE)
23
             printf("%d\n", tmp);
25
26
                                           Is it correct?
27
    int main(int argc, char *argv[]) {
28
29
30
         sem_init(&empty, 0, MAX); // MAX buffers are empty to begin with...
        sem init(&full, 0, 0); // ... and 0 are full
31
        sem init(&mutex, 0, 1);
                                  // mutex=1 because it is a lock (NEW LINE)
32
        // ...
33
34
```

Figure 31.11: Adding Mutual Exclusion (Incorrectly)

Appendix 1

31.7 How to Implement Semaphores

✓ Using mutex and condition variable

```
typedef struct __Zem_t {
1
         int value:
2
        pthread cond t cond;
3
        pthread_mutex_t lock;
4
    } Zem t;
5
6
    // only one thread can call this
    void Zem_init(Zem_t *s, int value) {
8
         s->value = value;
9
        Cond_init(&s->cond);
10
        Mutex init(&s->lock);
11
    }
12
13
    void Zem_wait(Zem_t *s) {
14
        Mutex lock (&s->lock);
15
        while (s->value <= 0)
16
             Cond_wait(&s->cond, &s->lock);
17
         s->value--;
18
        Mutex_unlock(&s->lock);
19
20
21
    void Zem_post(Zem_t *s) {
22
        Mutex lock (&s->lock);
23
         s->value++;
24
        Cond_signal(&s->cond);
25
        Mutex_unlock(&s->lock);
26
27
```

Figure 31.16: Implementing Zemaphores With Locks And CVs

Appendix 2

- 30.3 pthread_cond_broadcast: Covering Conditions
 - Memory allocation library for multi-thread env.
 - ✓ Issue: which one to wake up?
 - E.g.) no free space, T1 asks 100B, T2 asks 10B, Both sleep → T3 free
 50B → T2 wakeup: okay, T1 wakeup: sleep again, but T2 also sleeps
 - pthread_cond_broadcast() instead of pthread_cond_signal()

```
// how many bytes of the heap are free?
   int bytesLeft = MAX_HEAP_SIZE;
   // need lock and condition too
  cond_t c;
  mutex_t m;
  void *
   allocate(int size) {
       Pthread_mutex_lock(&m);
       while (bytesLeft < size)
           Pthread_cond_wait(&c, &m);
       void *ptr = ...; // get mem from heap
13
       bvtesLeft -= size;
14
       Pthread_mutex_unlock(&m);
       return ptr;
17
18
   void free (void *ptr, int size) {
19
       Pthread mutex lock (&m);
20
       bytesLeft += size;
       Pthread_cond_signal(&c); // whom to signal??
       Pthread_mutex_unlock(&m);
```

Figure 30.15: Covering Conditions: An Example

 Please read carefully the program in Figure 30.13, Figure 30.14 and Figure 31.12. It will be great helpful when you do the Lab. 2 ^^
